There are two adjusting screws, one of which regulates the main supply of fuel, and is clearly seen in the illustration; while the other, situated at the back of the carburetter and not visible in the diagram, regulates the size of the air passage leading to the bypass, and, consequently, the flow of fuel as well.

The construction of the carburetter is extremely simple. There are no moving parts or valves other than the throttle. The main air intake is through the funnel which secures the choke tube. The float chamber is held on to the vaporising portion of the carburetter by means of four equally spaced bolts, allowing the position of the float chamber to be easily changed and the carburetter instantly converted from a vertical to a horizontal one.

At present the carburetter is not very well known to motor-cyclists, but Mr. A. E. Willis succeeded in winning the one-mile and six-mile standing start races at St. Andrews, using this carburetter on a Douglas. So far as its use on a car is concerned, it has done extremely well, especially in an R.A.C. observed test in November, 1919, when most excellent results were obtained as regards both economy and efficiency.

We are now fitting a Degory No-jet carburetter to a motor bicycle, and hope to announce the results of its working in the near future.

The Degory carburetter is made by Messrs. Degory No-jet Carburetter Co., 93, Moore Park Road, Fulham, London, S.W.6.

50,000 TYRES A DAY.

A LUNCHEON was held at the Holborn Restaurant on July 26th with the object of introducing Mr. E. R. Preston, the new managing director of the Goodyear Tyre and Rubber Co. of Great Britain, Ltd., to the principal members of the motor press. The chair was taken by Mr. H. B. Levin, who called upon Mr. Preston to give a short account of the history of the Goodyear Co.

Mr. Preston began by complimenting the British papers on the sound lines in which they were conducted. He had recently had a motor tour in Great Britain, and had found the scenery to be full of variety and most attractive, and as regards our roads, he said they were "mighty good," however much we complained about them. He had lately been in Berlin, and found there how much pneumatic tyres were appreciated when they could not be had. The Germans had had an unparalleled opportunity of trying rubber substitutes, and found none of them satisfactory, in spite of their having been numerous contraptions introduced. The Goodyear Tyre Co. was started in 1898 at Akron, Ohio, and carried on the manufacture of carriage and bicycle tyres. Nine years ago, when he joined the company, the output of tyres was 2,000 per day, now it was 35,000, and he hoped that it would shortly be 50,000. They opened their Canadian branch in 1910, and in 1912 a branch was started in Great Britain, followed by branches in Glasgow, Bristol, and Belfast. They were now growing their own cotton, had their own fabric factory, and had bought their own coal mine, so that they can be never again short of material or coal, while they had their own rubber plantations in the East.

A few words were also spoken by Mr. Sidney Oxon and by Mr. Lucien King, the publicity manager of the Goodyear Co., who said he had come to learn English methods of advertising. The essentials of good advertising were, he told those present, to create interest, to call attention, and to tell the truth. Thanks on behalf of the press were proposed by Mr. H. C. Lafone of *The Autocar*.

A NEW NATIONAL ASSOCIATION

At a recent meeting of the Portsmouth and Hampshire Cycle and Motor Cycle Trades Association it was decided to change the name to the National Association of Cycle and Motor Cycle Traders, permission from the Board of Trade being asked to increase the membership by a further five hundred

Noisy Motor Cycles.

Our readers are warned that it is possible the Metropolitan police may take active steps in the very near future with regard to exceedingly noisy motor cycles. It should be borne in mind that the Metropolitan Police area is very extensive; for example, the northernmost boundary is Potter's Bar, and the southernmost Epsom. Much of it is in open country.

A Scottish Open Hill-climb.

The following classes will be run in the open hill-climb to be held at Lewinsdale Hill, Lanarkshire, on Saturday. Class 1 350 c.c., Class 2 600 c.c., Class 3 unlimited, Class 4 sidecars 600 c.c., Class 5 sidecars unlimited. This event is organised by the Western M.C.C., Glasgow, and will be held under the open competition rules of the Scottish A.C.U. Entries closed yesterday.

350 C.C. Machines.

The 350 c.c. Sunbeams have already been proved to be almost as fast as those of the 500 c.c. type, and the 350 c.c. A.J.S. in the Isle of Man demonstrated that another Wolverhampton machine would be a serious rival to that just mentioned. Only recently, H. R. Davies, riding one of the T.T. A.J.S. mounts, made fastest time of the day on Stile Cop, his time being 45⅘s., which is probably a record for the hill. Next year's Junior T.T., with a representative entry of these two Wolverhampton machines, should be interesting, while it is said that a Norton team will be competing in the Junior event.

The A.A. in Coventry.

The latest move of the A.A. is the opening of an office at 23, Hertford Street, Coventry, under the management of Mr. W. H. Stonier. Mr. Stonier is well-known in Coventry, having for many years been associated in an editorial capacity with sister publications of *The Motor Cycle*. During the greater part of the war he was in charge of the A.A.'s Birmingham branch at Central House, New Street.

Amongst Midland motorists Mr. Stonier has many friends, and, under his management, the Coventry office should speedily become an important branch of the A.A.

In Canada.

In Winnipeg, Canada, the authorities have a way of their own of dealing with those who exceed the speed limit. For the first offence, a fine is imposed; the second, a fine and the machine is impounded for a month; third offence, the offender is locked up for a month. Lastly, it is said, the culprit is to be incarcerated in a lunatic asylum. Already, we are informed, several cars have been confiscated.

The Sporting Constable.

At a North country trial recently, a local competitor told us that while doing a little unofficial speed trial in excess of 60 m.p.h., he was observed by a constable who waited until he stopped and then approached him. The rider had already commenced to produce his licence, when the policeman said, with evident interest, "Do you know, sir, that's the fastest motor cycle I've ever seen—*what make* is it?"

Lakeland Trial Awards.

The following is a complete list of the awards made in the Cumberland County M.C.C. open reliability trial, which took place last month:

Alan Trophy, gold medal, and first-class certificate: J. E. Greenwood (3½ Sunbeam sc.).

Cumberland County Trophy, gold medal, and first-class certificate: W. G. Harrison (3½ Sunbeam).

Carr Cup, gold medal, and first-class certificate: H. J. Birch (8 Le Zèbre light car).

Barron Trophy, gold medal, and first-class certificate: S. Parker (8 Royal Enfield sc.)

Best performance on a machine of 251 c.c. to 350 c.c. (special prize and first-class certificate): G. W. Wilkin (2¾ Wilkin).

Best performance on a machine of 351 c.c. to 500 c.c. (special prize): J. E. Greenwood (3½ Sunbeam sc.).

Best performance on a machine of 501 c.c. to 750 c.c. (special prize and first-class certificate): I. H. Dickson (7 F.N.).

Best performance on a machine over 750 c.c., excluding light cars (special prize and first-class certificate): R. E. Darnton (7-9 Indian).

Best performance in light car class (special prize): H. J. Birch (8 Le Zèbre).

Best amateur (pair of R.O.M. tyres value £10): R. L. Williamson (3½ Norton).

Second amateur (Matchless Cup): R. E. Darnton (7-9 Indian).

Gold medals and first-class certificates: T. C. de la Hay (3½ Sunbeam), E. Williams (3½ Sunbeam), J. A. Newman (3½ Sunbeam), J. W. Mills (2¾ Verus), S. Bell (3 A.B.C.), and G. Townsend (3½ P. and M.).

Silver medals and second-class certificates: J. J. A. Dias (3½ P. and M.), J. Wallace Moffat (4 Verus), T. J. Stordy (2 A.J.S.), G. G. Barnard (3½ Sunbeam), W. Westwood (4 Triumph), B. Hill (3¾ Scott), Wilfred Marley (3½ Lea-Francis), A. Ferris Morton (4 Harley-Davidson), W. Kantlehner (3½ Wilkin sc.), B. Jeffreys (4 Norton sc.), and T. B. Westmorland (7-9 Harley-Davidson sc.).

Bronze medals and third-class certificates: F. O. Huntrods (3½ Ariel), W. T. Tiffen (4¼ B.S.A.), D. Robb (3½ N.U.T.), F. Fieldhouse (3½ N.U.T.), A. E. Pape (4 Triumph sc.), J. H. Tiffen (8 Matchless sc.), B. S. Tatham (7-9 Harley-Davidson sc.), J. L. R. Jenson (7-9 Harley-Davidson sc.), H. M. H. Deeley (4 Triumph), and R. W. Loughton (3½ N.U.T.).

Winners of team prize: Worcester Motor Cycle Club "B" Team: T. C. de la Hay (3½ Sunbeam), E. Williams (3½ Sunbeam), and J. A. Newman (3½ Sunbeam).

Special Features.

ENGLAND v. HOLLAND.
INTERNATIONAL SIX DAYS TRIAL.
NOTES FOR THE NOVICE.

Taxation.

An amendment of the Finance Bill so far as it concerns motorists is that the new taxes will be confined to vehicles using "public" roads, and not extended, as was apparently the intention of the Government draftsman, to the mere "keeping" of a motor vehicle.

I.A.E. Programme.

The first meeting of the Institution of Automobile Engineers for the 1920-21 session will be held on Wednesday, October 13th, and subsequent meetings will be on the second Wednesday in each month up to May 11th, 1921. Birmingham meetings will be held on October 28th and December 30th, 1920, and February 24th and April 28th, 1921; the London graduates' section on the second Thursday in each month; Birmingham graduates on the third Wednesday in each month; and the Coventry graduates on September 28th, November 2nd, 17th, and 30th, December 14th, 1920, and January 4th and 18th, February 1st and 15th, March 1st, 13th and 15th, and April 5th, 1921.

Taxes in France.

As the result of the campaign which has been opened in France against the new sidecar and cycle car taxes, it is more than probable that a special annual tax of £4 per machine will be applied. It will be remembered that in the past the motor cyclist paid an annual tax of twelve francs, and when a sidecar was attached an additional tax of twelve francs had to be met. Under the new law, which seriously threatened the existence of the whole motor cycle movement, sidecars were to be considered as motor cars, which have to bear a minimum tax, a horse-power tax, a circulation tax, and several other smaller taxes, the total for the smallest powered machine amounting to about £18.

Parliament has now recognised that this is unjust, and the latest arrangement, which undoubtedly will become law, is that sidecar machines shall pay an annual tax of £4. The same treatment will be accorded to cycle cars which, up to the present, have sometimes been treated as motor cycles and sometimes as motor cars. The definition of a cycle car is a machine of not more than 1,100 c.c., and with a maximum weight of 770 lb.

P 2

NEWCASTLE CLUB'S TWO DAYS TRIAL.

TWO days borrowed from a normal summer, and sandwiched between a series of the sloppy days we have experienced during 1920, graced the Newcastle and District Motor Club's reliability trial on the first two days in August. The roads were good, the slight showers keeping the dust down, and the conditions throughout were delightful from a motorist's point of view.

The outward journey was *via* Hexham and Alston, direct to Penrith for lunch, including three controls; thence by a circular run of fifty-nine miles, through Keswick and Grasmere, Ambleside, and Kirkstone, and back to Penrith for the night. The evening was devoted to sociability, and as the majority of the sidecars carried lady passengers, a very pleasant time was spent.

The following day's run included Appleby, Brough, Middleton-in-Teesdale, Stanhope, and Alston. The Killhope Hill was observed. The road from Middleton was grassgrown and loose, and much time was lost at Stanhope in consequence.

After lunch the return journey was commenced from Penrith at 2.30, *via* Carlisle, Greenhead, and Chollerford.

The awards were as follow: C. Armstrong (7-9 Harley-Davidson sc.), Special Trophy and Collier Cup; A. S. C. Broadway (8 Matchless sc.), special prize and gold medal, error 5s. Gold medals: W. Crompton (4 Triumph), error 11s.; O. Birse (8 Rex sc.), error 14s. Silver medals: W. H. Lindin-Travers (4 Blackburne), error 18s.; F. Fieldhouse (3½ N.U.T.), error 53s.

YORK-EDINBURGH-YORK.

FIFTY competitors took part in the second annual York-Edinburgh-York reliability trial, organised by prominent Yorkshire clubs, held on August Bank Holiday. Starting from York Minster at 12.1 a.m., competitors followed the coast route, and were due back at midnight, the run taking exactly twenty-four hours. The weather was ideal, and everyone thoroughly enjoyed the run, only ten competitors failing to complete the distance. Very praiseworthy performances were put up by the two lady competitors, Miss S. F. Wilson (2¼ Velocette) and Miss E. Dent (2¾ Douglas), who both completed the course and gained special awards. Awards:

SOLO.—Solid silver cup (presented by Mr. R. A. Bonner, Stanningley), for best time: Guy Jeffreys (3½ Norton); total time error 3m. 12s. Cups were also awarded for not more than 15m. early or late at any check: W. Atkinson (4 Triumph), R. Almond (4 Triumph), H. D. Woodcock (3½ Rudge Multi), Maj. G. Jefferson (4 Triumph), G. A. Reed (3¾ Scott), T. V. S. Twentyman (3¾ Scott), H. Taylor (3¾ Scott), G. Eastwood (4 Triumph), A. C. de Pledge (4 Triumph), Miss S. F. Wilson (2¼ Velocette), J. S. Wilson (8 Zenith), A. Roberts (4 Verus-Blackburne), C. E. Turner, A. F. Morton (4 Norton), H. V. Walker (4 Indian Scout), G. Dawson (3½ Rudge Multi), W. V. Wright-Hull (4 Norton), and C. Sidney (3 A.B.C.). Special gold brooches (given by Mr. F. E. Wasling) were presented to Miss S. F. Wilson and Miss E. Dent, both of whom completed the journey, Miss Dent being also awarded a club silver badge brooch. Silver medals were awarded for not being more than half an hour behind scheduled time to W. Moss, J. F. Barnes, M. Sedgwick, and W. Padgett; bronze medals, W. R. Grantham and J. H. Holmes.

SIDECARS.—Special silver cup (presented by Palmer Tyre, Ltd.): T. C. Bullas (3½ P. and M.). Cups also awarded to B. Jeffreys (4 Norton), T. B. Westmoreland (7-9 Harley-Davidson), H. C. Anderson (6 Sunbeam), E. Wasling (3¾ Scott), and E. Hawkes (4 Douglas).

LIGHT CARS AND CYCLE CARS (Air-cooled).—Special silver cup (presented by Mr. Rowland Winn, Leeds): A. Clark (9 Richardson). Silver medal to C. E. Richardson (9 Richardson).

CYCLE CAR (Water-cooled).—Cup: W. Marriott (10 Morgan).

TWO-DAY TRIAL IN IRELAND.

IF only on account of the very fine scenery on the shores of Bantry Bay, it is surprising that the Dublin Club's 1920 two-day trial to Glengarriff did not attract more than twenty starters. The unsettled state of the country undoubtedly was responsible, and, we are told, some of the competitors were far from easy in their minds.

The two days' run covered a distance of approximately 450 miles, and the length of the journey and the nature of the roads traversed made it a trying test, despite the absence of any very severe hills. Eighteen of the starters reached Glengarriff on Saturday evening, but many of them were already without hope of awards. N. Lepler (Indian sc.) broke his sidecar axle in crossing Knockmealdown mountain. He was the only one to fail on this hill. J. Adair (4¼ B.S.A. sc.) damaged his sidecar wheel later on, but rebuilt it and continued. G. Smith (4 Norton sc.) was an early retirer, and E. Adair (3½ Premier sc.) was not seen after Cashel.

The eighteen arrivals at the turning point left for the return journey on the Monday morning, travelling *via* Kenmare, Killarney, and Limerick to Dublin. The following finished the course:

R. P. Hurse (4½ B.S.A.)
J. Browne (2¾ Douglas)
M. McAllister (6 A.J.S. sc.)
R. Humphreys (2¼ Velocette)
A. Carton (4 Indian)
N. Lepler (7-9 Indian sc.)
D. Allen (4 Norton)
T. E. Greene (3½ Douglas)
J. McEntaggart (7-9 Indian)
Hon. R. Massey (7-9 Harley-Davidson sc.)
J. Adair (4¼ B.S.A. sc.)
J. Doyle (3 A.B.C.)
P. McGrath (2¼ Velocette)

International Six Days Trial in France.

Twelve Competitors Complete the Alpine Course. Eight Lose no Marks. Switzerland takes the Team Prize.

AS recorded in last week's issue the starters in this year's International Six Days Trial totalled only fifteen. Such a small number revealed apathy on the part of manufacturers who, it is obvious, do not fully appreciate the importance of the event. In some quarters we have found that the trial has been confused with purely national events, whereas, although held in France and organised by a French club, the trial is the only one specially organised as an international contest to encourage competition among motor cyclists of various nationalities.

We gave some details in last week's issue of the first two days of the trial and the hill-climb on Laffrey Hill on the second day, in which Bernard (Indian) made fastest time *i.é.*, 6 min. 49⅗ sec.

The Results.

Of the twelve survivors who finished the course, eight had clean sheets. These were as follow:

350 C.C. CLASS.—Morand (Condor).
500 C.C. CLASS.—Naas (A.B.C.), Robert (Motosacoche), Rolly (Motosacoche), and Gabriel (Triumph).
750 C.C. CLASS.—Pinney (Triumph) and Bernard (Indian).
SIDECARS.—Gex (Motosacoche).

Switzerland, with its Motosacoche entry, takes the team prize. Below is given a list of those competitors who finished but lost marks:

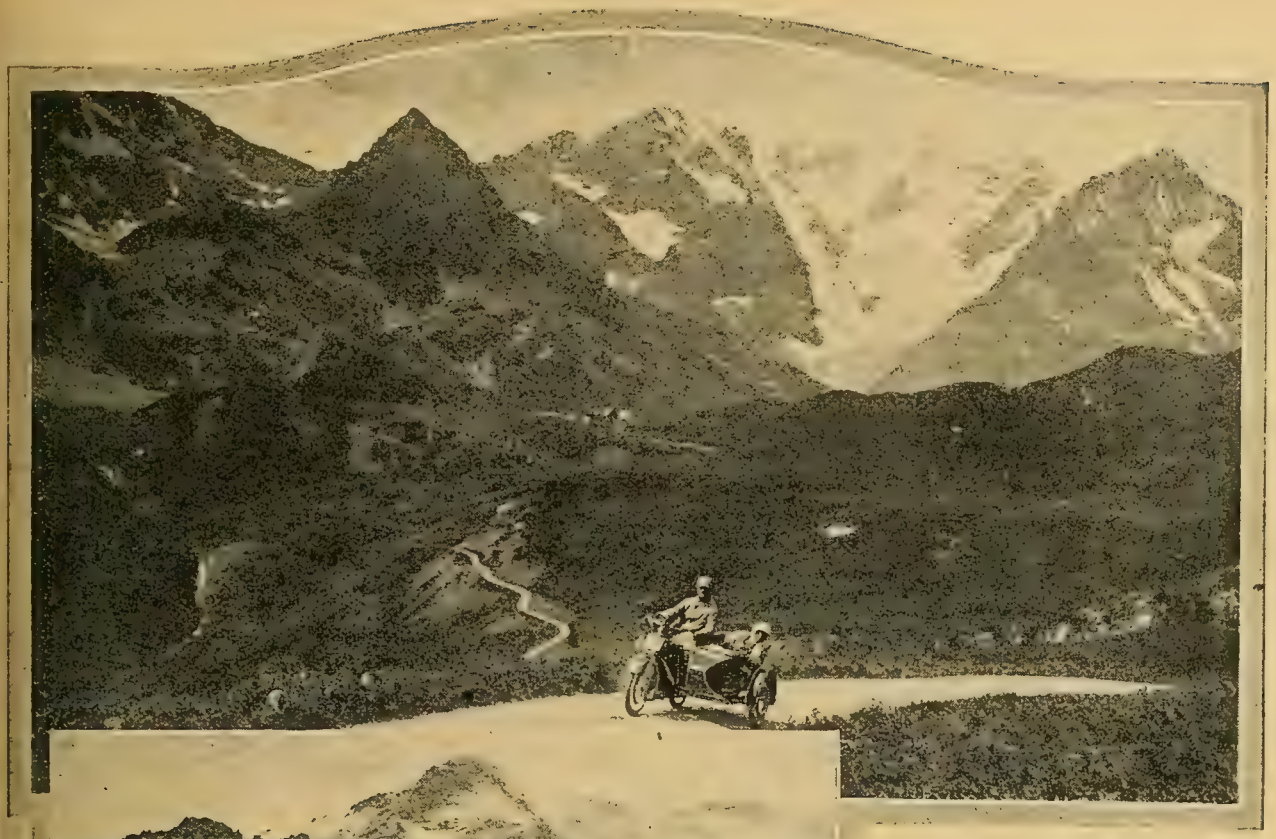
	Marks.
Detruche (A.B.C.)	67
Borgotti (A.B.C.)	44
Barthélémy (Scott)	31
Sandford (Morgan)	55

The first day's run in the mountains around Grenoble caused the elimination of only one rider, Gallien, on a Benoist-Gonin sidecar, thus robbing France of one of its members in the team competition. This day's run was rather difficult, for on four distinct occasions the competitors had to climb to altitudes of more than 3,000 feet, the highest point touched being the Col du Rousset at 4,297 feet above sea level. The road generally was of a chalky nature, and it frequently happened that the riders went into the dangerous bends in a cloud of dust. On one such occasion Graeme Fenton, the Franco-British rider, was brought down heavily with his Scott, but despite a damaged gear was able to continue and finish the stage without the loss of points.

The second day's stage—which comprised climbs over Col Bayard, 4,117 feet above sea level, and Col de la Croix Haute, 3,857 feet above sea level—was not as difficult as the initial stage, for it comprised well-made, hard, Alpine roads, with long but fairly easy gradients. The stage, however, was fatal to three competitors. Greame Fenton skidded and fell, and after his accident of the previous day was unable to repair his machine; consequently the Scott team was reduced to one member. Yenné, of the A.B.C. team, missed his way, and had several punctures, which lost him nine points. The A.B.C. team was not lucky, for another of its members, Detruche, was delayed by punctures, broke his saddle, and finally came in with a loss of three points.

The third day's trials completed the ill-luck of the A.B.C. team, for Yenné had to retire with magneto trouble, but afterwards joined in and continued unofficially, and his companion Detruche lost eight more points for late arrival. The great difficulty of the day was the climb to the top of Col de la Porte, 4,429 feet above sea level; this was followed in the afternoon by a climb over the Col de Plainpalais, 3,870 feet above sea level. In addition to these climbs, the morning stage was rendered very difficult by reason of rain, which made the roads slippery and dangerous.

The *pièce de résistance* was reserved for the last day in the Alps, when the competitors had to climb to the top of Galibier, 8,392 feet above sea level, with



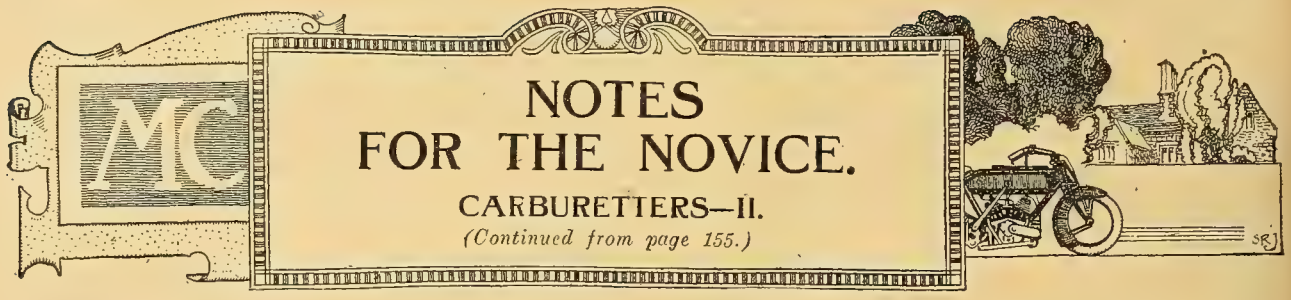
SCENES ON THE INTERNATIONAL SIX DAYS TRIAL.

(Top) A magnificent mountain panorama at one of the highest points of the course. Gex (Motosacoche), one of the winning team, at the Col de Galibier.

(Bottom) A control in the shadow of a towering peak on the Col de Galibier.

the Lautaret Pass at over 6,500 thrown in as an additional morsel on the way up. Lunch was taken at St. Michel de Maurienne, and during the afternoon a very difficult task was set the competitors with the four tunnels, Col de la Croix de Fer, and Col du Glandon. The roads, unlike those of the morning, were exceedingly rough, winding, and narrow, and any delay by reason of punctures was practically impossible to make up. In the run down from the Col de la Croix de Fer, Borgotti, who up to then had remained with Naas as clean score members of the A.B.C. team, punctured four times.

After the four days in the Alps the machines were placed on exhibition at Grenoble, thus giving the riders an opportunity of resting for a day before taking the two-stage trip to Paris *via* Macon and Nevers. Only three competitors had been eliminated, and three others had incurred loss of marks. As there were fifteen starters there thus remained nine clean-score competitors for the final two stages from Grenoble to Paris of 104 and 110 miles respectively.



NOTES FOR THE NOVICE.

CARBURETTERS—II.

(Continued from page 155.)

SOME little while ago there was a certain amount of controversy on the respective advantages of admitting the fuel to the float chamber at the top or bottom. Both are quite satisfactory if properly carried out, but I remember that at the time the arguments used in favour of top-feed had upon me an effect opposite to that which was intended. For instance, in the matter of moving parts it was pointed out that top-feed removed the necessity for toggles and joints which are subject to wear. True! but so does the bottom feed with the inverted needle. Then again when referring to the ease with which the needle can be removed, comparison was made with the inverted needle type, to get which the carburetter must be detached, oblivious of the fact that, where toggles or levers are used, the needle can be withdrawn with the cover. It is of course seldom necessary to remove the needle of any type, as a slight twist will generally get rid of any bit of grit which is preventing it from closing properly.

My own experience suggests that the top feed is less liable to flooding from the cause just mentioned, as any grit will naturally fall to the bottom of the float chamber, but that it is more likely to be stopped up by dirt coming through from the tank. I have experienced this with a top-feed, but never on the older pattern, the reason being that any dirt would tend to fall away from the valve and remain in the petrol pipe (see sketches). This is not very vital, as the obstruction is easily removed, but it may cause a stoppage on the road, more especially with a new machine, or when a fine gauze filter is not used when filling the tank. On the other hand, I have never yet known my present carburetter, a Claudel-Hobson with a top feed, to flood.

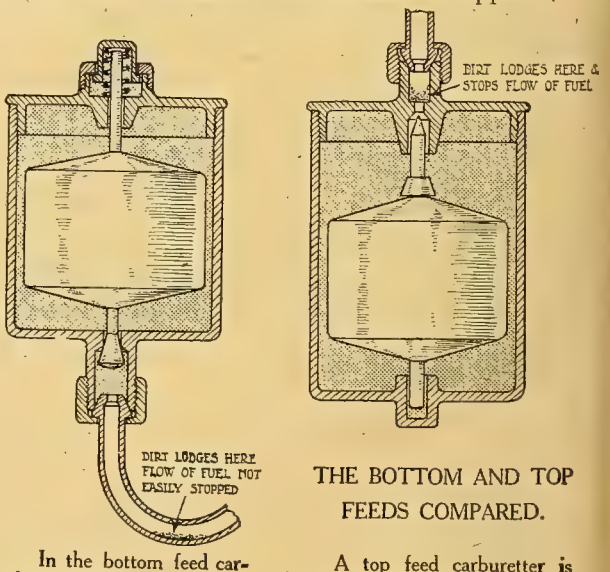
Warming Devices.

Because all evaporation causes coldness, the carburetter and inlet pipes become very cold unless some means is taken to warm them. In many single-cylinder motor cycle engines there is practically no inlet pipe, the carburetter being attached to a stub pipe close to the cylinder itself, and thus the whole is warmed directly by conduction of heat from the cylinder. Now a long inlet pipe is no disadvantage—rather the reverse, since it gives more time for the vaporisation of the fuel—unless it is so cold that it causes the vaporised petrol to condense upon its walls; but it makes it more necessary to have some warming device fitted, either a pipe which takes the air from some warm spot, say from a muff around the exhaust pipe, or better still a chamber surrounding the inlet pipe itself warmed by the exhaust gas, some of which is made to pass through it instead of directly through the silencer to the open air.

This is a great aid to the proper vaporisation and mixing of the gas, which should, so far as possible, be delivered to the engine as a dry homogeneous gas, rather than as tiny globules of moisture suspended in air. This tends both to economy and to steady running, and is more necessary in the case of an automatic carburetter than when a hand-controlled instrument is in use, since it renders the carburation less susceptible to changes of temperature.

Effect of Long Induction Pipe.

It is also more than ever necessary when a long inlet pipe, exposed to the draught caused by the movement of the machine, is fitted. The temperature of such a pipe, although it will of course be exactly equal to that of the surrounding atmosphere when the engine is started, will quickly drop owing to the fact already mentioned, that vaporisation causes a reduction of heat unless additional heat be supplied to it



THE BOTTOM AND TOP FEEDS COMPARED.

In the bottom feed carburetter stoppages in the pipe are not frequent.

A top feed carburetter is more easily choked by foreign matter.

from the exhaust, or in the case of a water-cooled engine from the radiator. This is very well carried out in the 1920 A.B.C., where a pipe about half an inch in diameter takes the hot gas to a chamber surrounding the inlet pipe where it branches off to each cylinder.

With the Capac carburetter can be supplied a flexible pipe which fits over the air intake of the carburetter and draws its supply of extra air from a muff surrounding the exhaust pipe. This is fitted with a door by which the amount of hot air can be varied as required by circumstances.

J.H.W.

Matlock and District M.C.C.

It is proposed to revive the Matlock and District Club. Any Matlock rider interested may obtain particulars from the hon. sec. of the E.M. Centre, A.C.U., Mr. J. Simmonds, 10, Cranmer Street, Nottingham.

Suffolk M.C.

The results of the gymkhana held on August Bank Holiday at Shrublands Park were as follow: Scooter race: 1, E. T. Elliott (Mobile Pup); 2, Mrs. Elliott (A.B.C.). Scooter obstacle race: Mrs. Elliott (A.B.C.). V.C. race: 1, E. T. Elliott (Metro Tyler); 2, D. Goldsmith (4 Harley). Coat and waistcoat race: 1, E. T. Elliott (Metro Tyler); 2, D. Goldsmith (4 Harley).

West Birmingham M.C.C.

The results of the recent reliability trial to Hereford and back were as follow: Under 500 c.c.: 1, S. Sprang (2¾ Douglas); 2, W. C. Shelton (2¾ Douglas). Over 500 c.c.: 1, E. F. Cope (7.9 Indian); 2, W. G. Deague (4 Triumph). Best performance of the day: H. L. Cranmore (3¾ Scott sc). Best passenger performance: H. B. Hartland (10 Morgan M.A.G.).

Liverpool M.C.

The Liverpool motor cycle traders recently organised a reliability trial for the Liverpool Motor Club, entries being confined to private owners. The course was a short sporting one of thirty-one miles in North Wales, and proved to be too severe for a number of riders. Of thirty-four starters only fourteen finished. The winners were: 1, E. A. Eastwood (American X); 2, R. R. Bromley (Triumph); 3, N. C. Sclater (Norton); , B. Caldwell (Norton).

Macclesfield M.C.

A reliability trial was recently held under the auspices of the Macclesfield Motor Club. Starting at the junction of Congleton Road and Moss Lane the course lay along the Leek Road to Bosley, up the Dumbers to Clewlow Cross, Allgraves, Burbage, Axe Edge, Upperhulme, Ruston, Bosley, Marton, Siddington, Broken Cross, and back to the starting point, a distance of fifty miles. The results were as follow: First prize and Birchenough challenge cup, . Leech (4 Douglas sc.); 2 and 3 (draw), . N. Drybrough (6 A.J.S. sc.) and G. W. owe (3½ A.B.C.); 4, H. Seel (4 Sunbeam). est sidecar single performance, W. Whitaker (3½ B.S.A. sc.). Fixed gear award, . Yates (3½ Triumph). Best lightweight erformance under 300 c.c., G. R. Wellgs (2¼ Dot). Consolation prize, J. R. ylde (2½ F.N.).

Stockport M.C.

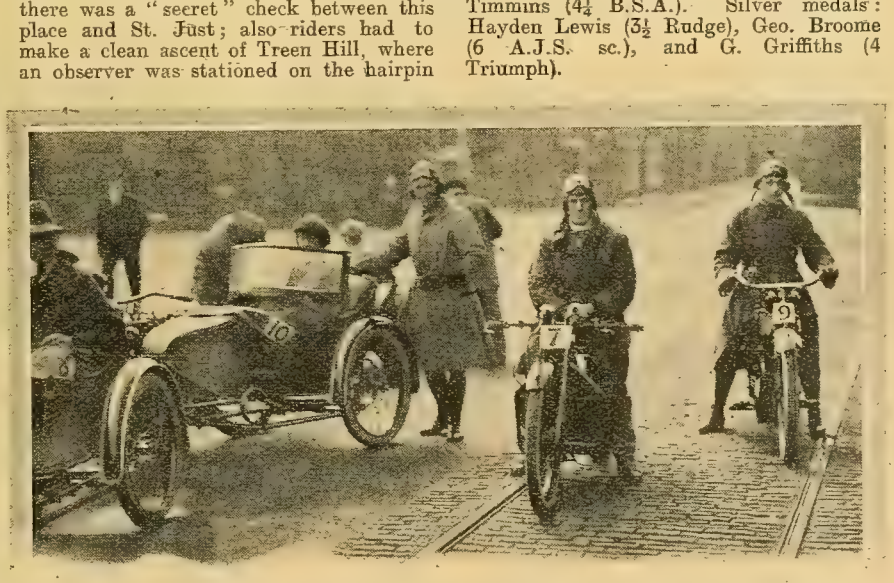
Recently this club held a non-stop inter-club run in conjunction with the Denton club. Each club was represented by three solos and three sidecars as follow: Stockport team: Solo—H. J. Scale (Scale), E. Abram (A.B.C.), B. Wallen (A.B.C.). Sidecar—H. Marsden (Matchless sc), F. Mottershead (Rover sc.), and J. Hulme (Indian sc.). Denton team: Solo—F. Cheetham (A.B.C.), W. Hall and A. Hoyle (Triumph). Sidecars—J. Walker, H. Clayton, F. Bingen, all on Triumphs. Starting from Kerridge the course lay *via* Macclesfield, Axe Edge, to Burbage, Cat and Fiddle, Macclesfield Forest.—Each team started with 600 marks, and the result was a win for the Stockport club by one and a half points; the winners lost thirty-three and a half points as against the thirty-five points dropped by the Denton club.

Penzance and District M.C.C.

The second reliability trial, held under the auspices of the above club took place recently, starting from Penzance Station at 6.15 p.m. There were sixteen entrants, and the course was a particularly trying one, being to St. Ives, and thence *via* the North Coast Road to Land's End (Sennen), returning *via* Treen Hill and St. Buryan to the "First and Last," Penzance, a distance of about forty miles. Competitors were checked at St. Ives, and there was a "secret" check between this place and St. Just; also riders had to make a clean ascent of Treen Hill, where an observer was stationed on the hairpin bend. The first prize (gold medal) was gained by S. Phillips, who made a very consistent performance with his Tamplin cycle car. He was run very closely by H. R. Wilcox and N. Trudgeon, the latter putting up a fine and praiseworthy effort on a single-geared machine of only 2½ h.p. The following members qualified for silver medals by obtaining over 85% of marks: H. R. Wilcox (2¼ Royal Enfield), F. L. Jeffrey (4 Triumph), W. H. Lawley (2½ Sun-Villiers), E. H. Thomas (3½ Rover), L. M. Chapman (2¾ Allon), W. Penberthy (4 Triumph sc.), R. J. Tregoning (4 Triumph), S. B. Haddon (2¼ New Hudson), and N. Trudgeon (2½ Royal Ruby).

Blaenavon M.C.C.

A successful reliability trial was held recently over a course of eighty-four miles. The route lay through Builth *via* Talgarth, over the mountain roads, to Brecon, thence to Llangynidr, over the Llangynidr Mountain to Beaufort, Clydach Valley, and back over Fiddler's Elbow to Blaenavon. The special award for the best performance was gained by B. R. Evans (8 Matchless), who completed the course non-stop with a total time error of only thirty seconds. Only eight of the twenty competitors finished the course. Results.—Gold medals: B. R. Evans (8 Matchless sc.), Gwyn Thomas (6 Juno-Jap), D. Lewis (2¾ Calthorpe), and W. T. Timmins (4¼ B.S.A.). Silver medals: Hayden Lewis (3½ Rudge), Geo. Broome (6 A.J.S. sc.), and G. Griffiths (4 Triumph).



A hilly route *via* Penrith and Carlisle was selected by the Newcastle and District M.C. for their recent Two-day Reliability Trial, a report of which appears on page 185. The photograph depicts competitors about to start for Penrith.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters must be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

APPRECIATION.

Sir,—May I trespass on the hospitality of your columns in the hope that my letter may meet the eyes of one, if not all, of those friendly motor cyclists who so kindly came to my aid on a recent Sunday, when my car overturned on Sawley Hill. Their ready and efficient help, so willingly given, did much to help me and my three passengers, two of whom were underneath the car, and I am anxious to convey to them all my warmest thanks, and to assure them that their action will always be remembered with the greatest gratitude and appreciation. H. TREVOR WANKLY.

MYSTERIOUS NOISES.

Sir,—I think that the following curious incident which occurred during a recent night run might interest you.

Hearing a slight rattle which I suspected to be a bolt in the foot brake pedal, I looked down, and, after ascertaining the source, noticed a tiny spark at the edge of the engine pulley.

I think it must have been the belt fastener touching the pulley every revolution. It ceased on decelerating and restarted on accelerating.

The solution of the incident is very simple, but was rather mysterious at first. I think that this might be interesting to your readers. J. BOORER.

Sir,—I note with interest your correspondent's article on mysterious noises in this week's *Motor Cycle*. I am also one of the sufferers of an aggravating tinkle somewhere down in the region of the engine, when the latter is just running light or taking up a load. I have had the engine taken down and examined. Everything was passed O.K. No loose bearings or faulty rings—in fact, everything perfect. The machine pulls splendidly, and has never given any trouble, and yet the wretched noise mars an otherwise perfect machine. I may add that I am a very careful rider, and nobody could take more care in trying to eliminate troubles within one's power.

Perhaps some other readers will offer some solution to this mystery. PUZZLE.

Carnforth, Lancs.

ROADSIDE COURTESY.

Sir,—Several letters have appeared in your columns recently concerning the courtesy shown by motor cyclists to those in trouble on the road. If your valuable space permits, I would like to place on record the courtesy, or something more, shown to me only just recently.

I was cycling home from Skegness and had a bad smash some ten miles from Boston, which rendered my machine quite useless and myself nearly so. Within a minute or so of my "noticing things" I had two offers of assistance. Two gentlemen with an already overloaded outfit offered to convey me to Boston, while another offered me the use of his sidecar for the matter of a sixty-odd mile run to Nottingham. I chose the latter course, with a view to better railway connection.

Not only was I taken to Nottingham, but my good Samaritan insisted on bearing the expense of a meal *en route*, and on arrival at the city went some considerable distance out of his way to see me safely into the railway station. Should this meet the eye of my benefactor (whose name unfortunately I do not know), I would like him to know that I reached home without difficulty; also that a badly sprained wrist and sundry lacerations are the sum total of my injuries. G.H.

Kettering.

M.M.G.S.

Sir,—Knowing the interest you have always taken in the affairs of the old M.M.G.S., or, as they are now termed, the M.G.C.(M.), I shall be greatly obliged if you will give publicity to this letter in your columns.

I find that I have lost touch with a good many old Army friends since demobilisation, and should be very glad to hear from old members of the 23rd Battery M.M.G.S., the 1st A.M.B., or the Light Car Patrols (Egypt).

Could not some sort of address exchange bureau be organised for the benefit of ex-members of this corps, so that members could get into touch again with old friends?

The opinions of your readers on this subject would be interesting, and possibly some scheme could be arranged.

ARTHUR M. PHILLIPSON,
Late No. 1868, M.M.G.S.

SCOTTISH ROADS.

Sir,—Having just returned from a 2,000 mile tour to the north-west of Scotland and back, a few notes may prove useful to your readers.

The Great North Road is good except for a few bad patches, until Yorkshire is reached. From the Yorkshire border to Alnwick it is pot-holed and bumpy. From Alnwick we cut across by Wooler and Coldstream to Melrose—a good road for these days. From Melrose to Edinburgh there is an excellent road through Lauder. Edinburgh to Stirling begins well, but falls off after Falkirk. From Stirling round Loch Earn to Crieff is very poor, owing to char-à-banc traffic, and it is the same at Crieff, Amulree, Dunkeld, Pitlochry, and Loch Rannoch. Pitlochry to Inverness is very fair on the whole for a Highland road, but round Inverness the roads are painful riding. Inverness, Gairloch, Ullapool, Lochinver, and Lairg had vile roads and perfect scenery, but one has to stop to enjoy it. Four sidecar springs broke under the strain, and were replaced by the blacksmiths at Pitlochry and Lochinver very well and cheaply. Anyone in a similar plight could not fall into better hands.

The homeward journey was down the east coast by Nairn, Banff, and Aberdeen over much improved roads. At Aberdeen the engine was taken down and decarbonised. The chain cases and magneto had to be removed, and the engine dropped out of the frame. The whole job only caused a day's delay, and was very well done by the Arcade Motor Co., of Diamond Street, whom I can heartily recommend. The result was a no-trouble run home, following the coast to Burntisland, then Edinburgh to Moffat *via* Peebles—another excellent road—and so on to Preston over very good roads. Preston, Warrington, and Chester were bad, but the rest of the run by Birmingham, Stratford, Stow, Burford, Oxford, Henley, and Windsor was quite good. The machine was a 1919 Matchless, and ran perfectly.

East Putney. PA 3345.

144 M.P.G.

Sir,—Regarding the reliability of two-stroke lightweights for every-day travelling, and economical cost of running, perhaps it may interest your readers to know that since April 12th up to the present time, I have travelled daily (Sundays excepted) between Hayfield and Oldham, a distance of eighteen miles each way, five miles of which are over roads in very bad condition. The district is very hilly, and I frequently have to take parts of the stiffest hills on low gear. My mount is a 1919 2¼ Velocette, with Amac carburetter, and I keep a very careful account of all expenses in connection with the journeys.

Including slow travelling through Oldham and Ashton and on rough roads, the journey takes me from an hour to an hour and a quarter each way, and my petrol consumption from April 12th to the present time averages 144 miles per gallon. I have had no mechanical breakdown at all, and since fitting heavy tyres have had no tyre trouble.

I have no interest in the Veloce Company, but in my case the two-stroke lightweight is proving itself most reliable.

THOS. H. WHEELDON.

DUST RAISING.

Sir,—As a regular reader of *The Motor Cycle* for some years, I am always interested in the page devoted to "Letters to the Editor." I have occasionally noticed that correspondents who reply to letters published are not always as courteous as they might be, and would like to make a plea for a little restraint by these motor cyclists.

The example which caught my eye was "Old 'Un's" reply to "Hugh" *re* "Dust Raising." Was it really necessary for him to bring in his remarks about "road manners," "decent people," and "hogs"? There seemed to me to be too much "implied" in that letter for it to be in good taste.

The fact that "Hugh" wrote to *The Motor Cycle* for advice showed his good faith (however much his query may have surprised some of us), and he was entitled to a courteous reply.

D.H.D.

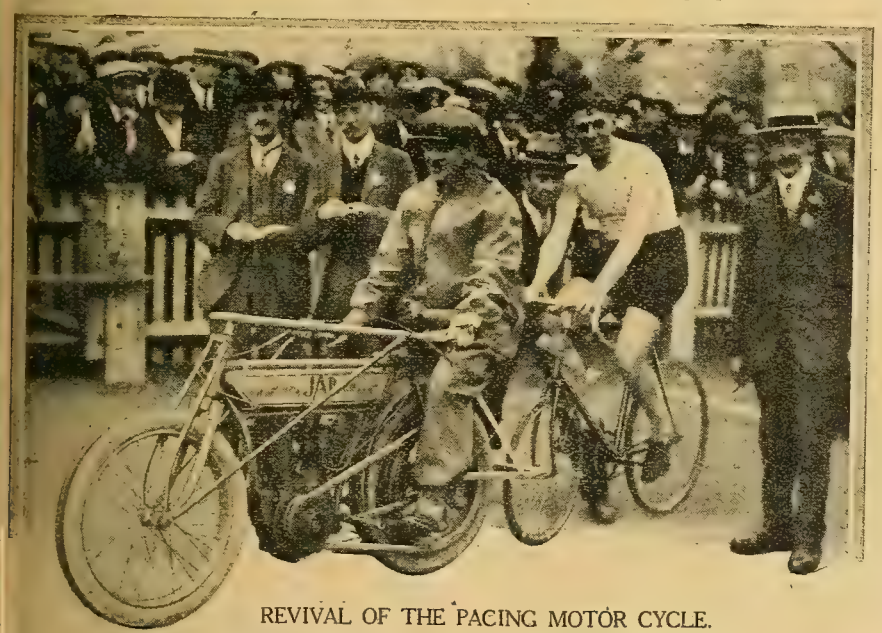
Sir,—I think it quite time "Hugh" had a tutor to teach him the rules and manners of the road.

Whoever heard of anybody going for "an easy comfortable ride," and making it "uncomfortable" for other people, *especially ladies?*

If they were travelling too slowly for "Hugh," it would be up to him to keep his "'bus" accelerated until he had passed them sufficiently to clear them of his dust, or else keep behind (in their dust if he likes).

He is either inexperienced, or else a road hog. The former will certainly cure himself while the latter is hopeless.

Bristol. AE 1167.



REVIVAL OF THE PACING MOTOR CYCLE.

Leon Meredith, an old path racer, after breaking the five miles motor-paced record at the Paddington Recreation Ground. The motor cycle was specially built for pacing purposes.

FOUR-CYLINDER MOTOR CYCLES.

Sir,—I believe Mr. J. Stonehouse, in his letter in *The Motor Cycle* of July 8th, expresses the requirements of a very large section of the British motor cycling public, *i.e.*, the requirement for a British four-cylinder machine. It is unnecessary to point out the obvious advantages of this type; these have many times been dealt with in your columns. It does, however, seem necessary to impress on the British manufacturer that a ready sale awaits a machine of this type, constructed on sound engineering lines. Four-cylinder motor cycle development has hitherto been left to the Americans, and to the famous F.N. Co. Is it not now time that Britain took a hand, and secured both the home and the colonial market which undoubtedly exists for these machines?

S. LATOUR HORDLE.

SPARE CHAINS AND TUBES.

Sir,—"Ixion" asks for suggestions how to carry spare chains and tubes.

I have found that the spare front chain of my Triumph can be carried along with the spare tube in the new aluminium non-chafe tube carrier which was conspicuous on many of the machines in the Scottish Six Days Trial.

The chain should be wrapped in greaseproof paper if oily and wound round the spindle of the carrier, a disc of cardboard being interposed between it and the tube.

There is plenty of room in the tube carrier for both, but of course a full length driving chain could not be stowed away in this way.

The method is ideal on a chain-cum-belt machine.

C. E. PLOWMAN.

THE THREE-WHEELED RUNABOUT.

Sir,—As a convinced believer in the three-wheeler I read with much pleasure your editorial in *The Motor Cycle* of July 29th. Towards the end of last year there was a small boom in three-wheelers, but, like many other booms, it seems to have been short lived. Scarcely half a dozen have survived, and even of these, with the exception of the Morgan, very few are as yet seen on the road.

You say truly that the three-wheeler is a "simple and inexpensive proposition." Unless it is this it has no reason to exist. It has its limitations. If you want "a car of distinction"—something that looks like a Rolls-Royce, but isn't—you will not get a three-wheeler. I do not admit that on purely æsthetic grounds the three-wheeler is inferior in appearance to the light car. It really looks as well, but no one can say that it looks the same. One cannot swank about "my little car"; which, as I gather, is what a good many people wish to do—though one may swank a bit on the road when the other fellow's "little car" is left behind. One cannot pile luxuries and complications on the three-wheeler, or it loses its simplicity and lightness and in consequence its speed, reliability and economy. The over-developed three-wheeler is a monstrosity. Moreover, the three-wheeler must make its way by *proved* merit. Light cars have found (and possibly may still find) patrons on account of their appearance, or even their advertisement. But it will not be so with the three-wheeler. It is true that at Olympia last year anything on wheels found purchasers. Agents and public were out to buy all that they could get. That will not be the case this year. It seems, therefore, strange that, with the exception of the Morgan, three-wheelers have been conspicuous by their absence, or at any rate by their rarity, at public competitions. One hopes that the great opportunity of the A.C.U. Six Days will not be lost, and that every self-respecting three-wheeled runabout will be represented. If such opportunities of proving their merits are neglected, the untried cycle cars have no chance of competing for public favour with the well tried sidecar combinations.

H. GEORGE MORGAN.

HOTELS.

Sir,—Last week while travelling through Doncaster with my daughter we called at the Reindeer Hotel for a meal, after which my daughter visited the bathroom for a wash.

When we reached Chatham my daughter discovered she had left her wrist watch behind in the bathroom. We did not know the name of the hotel at the time, so communicated with the police, giving description of hotel, with the result that in two days we received the watch by registered post (together with a courteous letter) from the manager of the hotel.

I think these facts should be a good recommendation to any motorists visiting Doncaster to use this hotel, where, I can assure them, they will receive every attention, as we did, and at a moderate price. C. S. COLLINS.

CHAIN DRIVE ON SPRING FRAME MACHINES.

Sir,—"Ixion's" comments on the fitting of chain drives on spring frame motor cycles, in your issue of July 22nd, were most opportune. A manufacturer apparently sets out to produce a spring frame mechanism which does not absolutely infringe a competitor's design, and then decides to connect his driving wheel to his countershaft by means of a chain, forgetting that a chain drive is just as important a piece of mechanism as the spring frame.

As "Ixion" so clearly points out, owing to the centre of the countershaft sprocket not being coincident with the centre of the pivot of the rear springing, a variable tension is thrown on the chain during the movement of the spring frame. He does not, however, point out what I consider to be the most serious objection to this general arrangement, and that is, that at the maximum movement of the spring frame the chain can become so slack that it will mount the teeth of the back wheel and strain itself or break. In one case that recently came to my notice the vertical movement in the chain varied from .5in. to 2.75in., according to the relative positions of the sprung and unsprung portions of the bicycle.

It must be remembered that the very conditions that bring the spring frame into action (*i.e.*, road shocks) also set up a corresponding period of vibration in the chain, which causes a slack chain to whip violently, and is liable to damage described above.

The ideal arrangement would, of course, be a spring frame, with the centre of pivot of spring coincident with the countershaft sprocket spindle, and, to my mind, the maker who first of all introduces this arrangement will reap the benefit to be derived from introducing an efficient spring-frame design to the motor cycle public. T.

Altrincham.

BLEA TARN PASS.

Sir,—With reference to your short report regarding the excursion to Blea Tarn Pass by several well-known competitors the day following the date of the open trial held in the Lake District recently by the Cumberland County M.C.C., I think it only right that you should acquaint your readers with the following facts.

I have no desire to depreciate in the slightest degree the climbs of this formidable pass made by G. Dance, T. de la Hay, G. Wilkin, S. Parker, etc., but in view of these fine performances it might be difficult for an outsider to understand why the Trials Committee of the club decided, after careful consideration, to omit the climbing of this hill from their recent trial.

Several visits by members of the Trials Committee were made to this hill, and on every occasion we were there the surface was in an appalling condition. It was well nigh impossible for a solo machine to make a perfectly clean ascent. We have plenty of members of our club who climbed this pass, but, owing to the appalling surface, caused by the loose shingle, these riders had to use their feet to steady their machines on the way up. We were never able to get sidecars up with passengers sitting in a normal position in the sidecar, but with a passenger sitting on the carrier it was managed once or twice.

Our committee reluctantly came to the conclusion that to include this hill in the trial would cause a tremendous amount of complaining through being baulked.

We in this district are perfectly aware that the nature of our mountain roads is such that heavy rain has a binding effect on their surfaces, but never in our wildest dreams did we imagine that Blea Tarn Pass could be in such a passable state as it was during the week-end of our trial. The condition was entirely brought about by the perfect deluge of rain we had had for several days previously.

The surprise was on a par with the one we experienced at the small quantity of water coming down the watersplash at Longlands ford. W. B. ANDERSON,

Hon. Treasurer Cumberland County M.C.C.

CLUB FOR EX-OFFICERS.

Sir,—I think the suggestion of "Blip Switch" with reference to a club for ex-R.A.F. officers very good; but why reserved for officers? There are many ex-R.A.F. men who possess motor cycles but would be barred from the club simply because they were not officers.

During the war an officer was certainly considered in a different class from the rest, but the distinction was only for the purpose of discipline, and I hope "Blip Switch" is not of the type that still considers himself beyond the reach of the man that served in the ranks. Surely this class distinction is ended.

I should like to see the motor cyclists one body ready to help each other at any time whether they were officers or otherwise.

I hope "Blip Switch" will reconsider his suggestion, and make the club open to all who served with the R.A.F.

WALTER L. LORD.

PRICES.

Sir,—It is with pleasure we note and endorse the remarks of your correspondent "Big Single" in your issue of the 29th ult. relative to the sterling value contained in the present-day Quadrant products. It is certainly a fact that there is no combination on the market to-day, embodying the same or similar specification, listed at a price within a £10 note of the Quadrant price. We believe we are correct in stating that the Quadrant works are available for inspection by anyone interested, and a half-day spent there will at once explain why the Quadrant is cheaper.

Your correspondent is somewhat in error in referring to the present Quadrant Co. as having been reconstructed so recently as 1914. It was in 1911 that the present proprietors acquired the Quadrant and built the new works. Mr. T. Silver (the designer and works manager) and a large proportion of the *personnel* have been engaged in the manufacture of Quadrant motor cycles since 1900.

We have in our possession an 1887 pamphlet, illustrating the Quadrant of that day, this being the Quadrant No. 8 large pilot wheel tricycle, with chain drive and spring forks—surely an anticipation of present-day requirements. Since those days the Quadrant has played its part in three wars, was the first machine to cross Africa, had its works utilised as an aeroplane and mobile workshop engine factory during the last war, and now, in the thirty-fourth year of its existence, is becoming famous as the motor cycle "By appointment to the new poor."

THE CLIFFORD WILSON MFG. CO.
C. WILSON.

BOOKS AND MAPS FOR MOTOR CYCLISTS

Issued in conjunction with *The Motor Cycle*.

	Price net.	By post
"MOTOR CYCLES AND HOW TO MANAGE THEM." The standard handbook on the motor cycle. Covers every subject relating to all types of motor cycles, their management and care. Twenty-first Edition. Just published	2/6	2/10
"HINTS AND TIPS FOR MOTOR CYCLISTS." Containing over 400 useful "wrinkles" and helpful hints in regard to motor cycles. Seventh Edition.	2/-	2/3
"TRACING MOTOR CYCLE TROUBLES." A reliable system for tracing motor cycle faults and of remedying any trouble when found. Fourth Edition.	2/-	2/3
"THE MOTOR CYCLE" ROAD MAPS. **England and Wales, Scotland, London** (showing roads into and out of London and avoiding London). Mounted on linen. Set of three, complete in case.	5/6	5/10
"THE MOTOR CYCLE" ROUTE BOOK. With 32 pages of Road Maps of England and Wales, Scotland, and the London District. New Edition. Just published	5/-	5/4

Obtainable by post (remittance with order) from ILIFFE & SONS Ltd., 20, Tudor Street, London, E.C.4, or of leading Booksellers and Railway Bookstalls.

QUESTIONS AND REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not **must be accompanied by a 2d. stamped addressed envelope for reply.** Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Testing Alignment.

? I should like your advice on the following point. I suspect the back wheel of my outfit to be out of truth in the forks, but owing to the build of the machine it is impossible to set up a straight edge, and the chain adjusters are no guide. Looking towards the front of the machine, if the tyre showed more wear on the left side of the tread, would that indicate that the front of the wheel was setting to the right or the left of the true centre line?—B.R.C.

The usual method of testing wheel alignment is to stretch a cord across the lower part of the wheels from the front to the back of the machine. This should touch the rims or be equidistant from them at the four points of circumferences over which it passes. Uneven wear of the tyres is not an exact guide, but it gives some indication that the alignment is not absolutely correct.

Breakage of Overhead Valves.

? I am the owner of a single-cylinder 4 h.p. Rex-Jap motor cycle, overhead valves, 90 × 77½ mm., and recently I broke the exhaust valve (J.S.N.-J.A.P.), thus damaging the piston beyond repair. Will you please let me know: (1.) If anything can be fitted to prevent such valve breakages? (2.) Would it suit if I get one made from tungsten steel at 25s.? Would this be unbreakable? (3.) How would drilling the valve right through, and fitting a Bowden inner cable with nipple flush at each end, answer in case of breakage? (4.) I am anticipating fitting an aluminium piston, probably a Ricardo. In this case, should I have to rebalance the engine, and would there be any advantage in fitting one? (5.) Will you please give me correct timing for this engine in the simplest form?—H.L.M.

(1.) It is possible to fit valve cages by screwing small L-shaped lugs into the cylinder head so as to catch the valves if they drop. (2.) You should have no trouble with your exhaust valves if they are made of stainless steel or tungsten alloy of about 18%. (3.) Drilling the valve and fitting a Bowden cable might work satisfactorily as a safety device, but it will probably infringe on the Buckingham patent, which consists of a spoke let into a hollow valve stem. In this patent the valve head is arranged so that it drops on to a projecting ledge of the cylinder, and thus, even if the valve breaks, it is unable to get on to the top of the piston, since the spoke acts as a guide. (4.) If you use a "Ricardo" piston, which will be considerably lighter than your present cast iron piston, the engine must be rebalanced to get good results. The use of such a light piston will probably give you somewhat higher speed, and will reduce the wear on the big end to a certain extent, owing to lighter reciprocating parts. (5.) With regard to the valve timing of the engine, you would be safe in arranging that the exhaust valve closes dead on top, or a fraction after top dead centre. This, of course, will give you correct setting for the valve inlet, which is operated by the same cam.

Removing Scott Crankshaft.

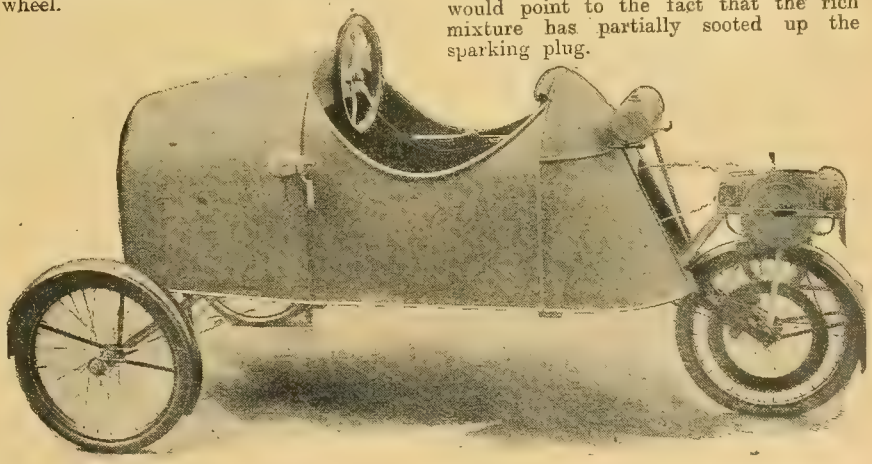
? I have a 1911 3¾ h.p. Scott machine, and I wish to take the engine down in order to have the crank case welded. I have taken out the crankshaft bolt, but cannot move the cranks; would you give me the correct way to take these off, and which side first?—F.J.D.

To dismantle the crankshaft and flywheel assembly of the Scott engine, proceed as follows: Remove the left hand lock nut of the central bolt and then unscrew the bolt itself five or six turns. One or two sharp blows on the head of this bolt should now drive out the right hand crankshaft, when the bolt is completely unscrewed and the crank removed. The left hand crank is knocked out from the right hand side, using a steel bar which is passed through the centre of the flywheel.

Over-rich Mixture.

? Will you kindly give me your advice upon the following trouble concerning my two-stroke? The engine is a 1920 2¾ h.p. T.D.C., B. and B. carburetter using benzole. The machine will run very well at speeds up to about 15 m.p.h., but if I open the throttle above this speed, a series of loud explosions occurs and flames come from the silencer. The trouble ceases as soon as the throttle is closed as before. I have tried a Lodge standard, an Aero plug, and also a single point of good make. The carburetter is clean, and the jets I have tried were 27, 28, 30. The lubrication is by drip feed, and although I have varied the setting the result is the same. Furthermore, although the machine will run and start easily from cold, if I stop for half an hour or so, it is impossible to get more than about half a dozen explosions from it upon restarting.—H.C.

Your trouble appears to be connected with carburation, and might be explained by the following: After a certain throttle opening, the mixture becomes too rich, and is incapable of ignition by means of the spark in the ordinary way. This charge is expelled into the silencer and would possibly be ignited by the following charge, provided that this was fired by the spark. We should suggest that you reduce the size of the jet and lower the petrol level. The fact that the machine is sluggish in starting, after being run, would point to the fact that the rich mixture has partially sooted up the sparking plug.



The 2 h.p. Cambro monocar, manufactured by the Central Aircraft Co., 179, High Road, Kilburn, N.W.6. It has a Johnson motor wheel engine unit (flat twin two-stroke) and 20in. wheels. The price of the vehicle is 79 guineas.

Slight Blow-back.

(1.) My machine is a two-stroke two-speed Radco. The cap covering the air intake is always full of oil, which blows back through the carburetter. Can this be remedied? (2.) The engine makes a very loud exhaust, so I have fitted a round tin drilled with holes in the silencer. Will this damage the engine?—W.L.

(1.) Provided the machine runs satisfactorily, we should not advise you to make any alteration with a view to preventing the slight amount of blow-back through the carburetter; this defect is usually caused by the mixture being too weak or by the ignition being unduly retarded. (2.) The baffle which you have fitted in the silencer will not damage the engine in any way.

Mysterious Lack of Power.

I have a motor cycle fitted with a 2½ h.p. J.A.P. engine, and as I seem to obtain by no means satisfactory results I am approaching you for your kind help in tracing the trouble. Internally, the engine seems in perfect order; externally, there is nothing to be desired, except that the crank case gets oily. All bearings work freely, without the slightest up and down play in either the big or little end bearings, or worn rings—in fact, as I have already said, all bearings seem in new condition. Compression is really very good, and there are no brown marks on the piston rings to denote blowing past of compressed gases. Valves and ignition are all timed correctly, and there is no carbon deposit in the cylinder or on the piston, as I have cleaned all this off, and yet I still get the same trouble. The machine is fitted with an Amac two-lever carburetter and a No. 27 jet. When I took the machine out for a trial run after the overhaul recently I found not the slightest difference in the power of it, and although I obtained a fairish speed it failed on a hill on top gear (4¾ to 1), but managed to crawl up on low gear (9½ to 1). The cylinder was very hot—in fact, it was "glowing," so to speak, and the crank case was also very hot. Compression was still quite good even with the engine warm, and it cannot be through under-oiling, as when I overhauled I flushed all bearings with paraffin oil, then with lubricating oil, drained this, and then gave a liberal supply of fresh oil. When running, the drip feed was set to empty the pump in about eight miles, and at the foot of the hill I gave it a full pump and set the drip faster. The trouble cannot be due to over-oiling, as suggested by smoky exhaust. The valve springs are quite strong enough, so I really cannot make out why this machine, with my light weight (8½ st.), should fail on a small hill. There is quite a powerful spark at the plug.—P.E.T.

From your description, the engine appears to be in perfect order, and it is therefore almost impossible to suggest a cause for its poor performance on hills without actually inspecting it. Possibly the exhaust valve tappet clearance is too great, thus causing early closing of the valve. The spark may possibly be advanced too far, or the sparking plug may be defective, causing pre-ignition. Try the effect of a slightly larger jet, say, 28 or 29. We presume, of course, that you have eliminated such obvious causes of the trouble as a binding rear brake, tight wheel bearing, etc., and have satisfied yourself that there is no undue friction arising from the gear box.

EXPERIENCES WANTED.

"W.E.B." (Holloway).—Eta carburetter on 4¼ h.p. single with sidecar. Starting, slow running, power, and economy.

IMPORTANT DATES.

Wed., Aug. 18th—
South Wales Club's Open Speed Championship on Penchine Sands.

Mon., Aug. 23rd, to Sat., Aug. 28th—
A.C.U. Six Days Trial.

Sat., Sept. 4th—
Scottish Speed Championships at St. Andrews.
Scott Trial in Yorkshire.

Nov. 29th Dec. 4th—
Olympia Motor Cycle Show.

RECOMMENDED ROUTE.

BRADFORD TO CARLISLE.—S.W.

Bradford, Menston, Burley, Ilkley, Skipton, Settle, Ingleton, Kendal, Shap, Penrith, Carlisle.

DERBY TO SCARBOROUGH.—ANTI-RAILWAY.

Derby, Ripley, Chesterfield, Sheffield, Rotherham, Doncaster, Selby, York, Malton, Scarborough.

NEWPORT TO TORQUAY.—E.I.

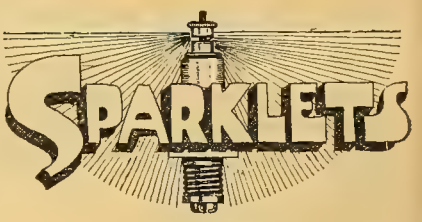
Newport, Usk, Monmouth, Coleford, Little Dean, Westbury, Gloucester, Frocester, Stone, Alveston, Almondsbury, Bristol, Redhill, Sidcot, Highbridge, Pawlett, Bridgwater, Taunton, Wellington, Willand, Cullompton, Exeter, Alphington, Chudleigh, Newton Abbot, Torquay. Approximately 110 miles.

PETERBOROUGH TO ILFRACOMBE.—C.W.S.

Peterborough, Yaxley, Stilton, St. Neots, Sandy, Shefford, Hitchin, Luton, St. Albans, Watford, Rickmansworth, Denham, Slough, Maidenhead, Twyford, Reading, Newbury, Hungerford, Marlborough, Calne, Chippenham, Box, Bath, Radstock, Wells, Glastonbury, Bridgwater, Minehead, Lynton, Ilfracombe.

BIRMINGHAM, TORQUAY, ILFRACOMBE, LYNTON, AND WESTON-SUPER-MARE, BIRMINGHAM.—C.W.B.

Birmingham, Alcester, Evesham, Winchcombe, Cheltenham, Leckhampton, Painswick, Stroud, Nailsworth, Bath, Radstock, Shepton Mallet, Ilchester, Ilminster, Chard, Honiton, Exeter, Exminster, Dawlish, Teignmouth, Torquay, Newton Abbot, Bovey Tracy, Moretonhampstead, Okehampton, Hatherleigh, Merton, Torrington, Bideford, Barnstaple, Ilfracombe, Lynton, Countisbury, Porlock, Dunster, Bridgwater, Pawlett, Highbridge, Brent Knoll, Bleadon, Weston-super-Mare, Worle, Congresbury, Bristol, Thornbury, Stone, Gloucester, Tewkesbury, Worcester, Droitwich, Bromsgrove, Birmingham.



New Prices.

The prices of Ariel motor cycles are now as follow: 3½ h.p., £120; 6-7 h.p., £140; sidecar, £37 10s.

Agents Wanted.

The makers of the Beardmore-Precision motor bicycle, Messrs. F. E. Baker, Ltd., King's Norton, near Birmingham, intimate that they are open to receive applications for agencies during the forthcoming season from districts where they are not already fully represented.

Catalogues Received.

The latest catalogue of Messrs. Weatherproofs, Ltd., 10, Lovell's Court, Paternoster Row, London, E.C.2, includes the Wim rubbered motor cycle suit. We have been using one of these during the last six months, and have found it to be quite waterproof in the heaviest of rains.

Surplus Tyres.

Messrs. Leo. Swain and Co. have been appointed sole sales agents for the Slough Trading Co., for the whole of the Government surplus tyres, solid and pneumatic. Enquiries for these tyres should be sent to 237-239, Deansgate, Manchester, or to Leo Swain and Co., tyre sales agents, Slough Depot, Bucks.

An Alteration of Title.

Mr. A. H. Hunt, the vendor of numerous electrical and other accessories which are so popular among motor cyclists, informs us that he has altered the style of his firm, which in future will be known as Messrs. A. H. Hunt, Ltd., H.A.H. Works, Tunstall Road, Croydon, Surrey. Mr. A. H. Hunt, together with his son, Mr. Cyril H. Hunt, are joint managing directors.

Assistance.

A 4 h.p. Douglas sidecar, owned by a High Wycombe reader, recently towed for four miles a broken-down Ford car containing the Mayor of that town, weighing seventeen stones, the Mayoress thirteen stones, their daughter eleven stones, and two other persons of twelve and fourteen stones respectively. In addition, there were the motor cyclist and a passenger, making a grand total of eighty-eight and a half stones plus the Ford, and a heavy chain used for towing.

An Advance in Price.

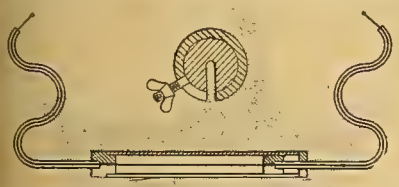
We have been asked to state by the Tamplin Engineering Works, Kingston Road, Staines, that in connection with the necessary advance in price of the Tamplin cycle car, which is now £150 plus 20%, several detailed improvements are being carried out, such as the engine fixing, the rear spring bearer allowing for adjustment of the rear springs, and the exhaust rear tail pipe. Arrangements are also being made to supply these improvements to present owners of the vehicle at cost price.

SOME RECENT PATENTS.

REVIEWED BY B. H. DAVIES.

Latest Details in Design, as revealed by the Patent Files.

MR. and Mrs. Warne have certainly succeeded in inventing a promising adjusting device for Bowden wires, which has the special merit of being finger-operated, and of affording a very large range of settings. The sketch is tolerably self-explanatory. The sheath is cut away amidships, and a short tube is fitted over the internal wire or core, being slotted for the purpose. The tube is fitted with

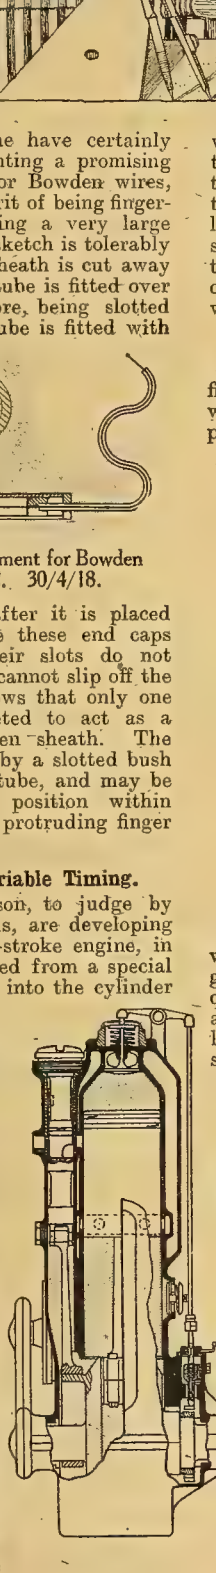


A. and H. Warne's adjustment for Bowden cables. No. 136,912. 30/4/18.

slotted end caps, and after it is placed in position on the core these end caps are turned, so that their slots do not coincide, when the tube cannot slip off the core. The drawing shows that only one of the end caps is socketed to act as a "stop" for the Bowden sheath. The second stop is provided by a slotted bush which slides inside the tube, and may be locked in any desired position within the tube by means of a protruding finger and a wing nut.

Two-stroke with Variable Timing.

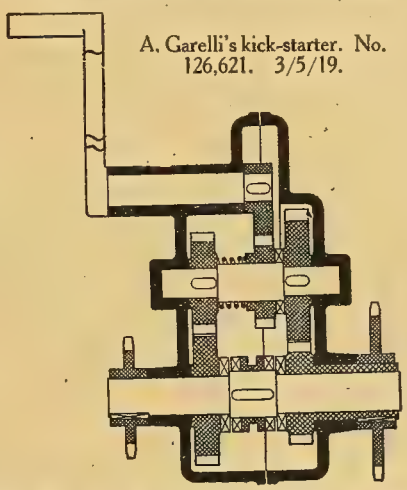
Messrs. Lynn and Fison, to judge by the Patent Office records, are developing an unusual type of two-stroke engine, in which the fuel is supplied from a special compressor and injected into the cylinder late in the upward stroke of the piston, thus allowing the crank case to be utilised for compressing a scavenging charge of air. It would appear that during their experiments some difficulty has been encountered in obtaining a good mixture, since a proportion of the air used for scavenging mingles with the injected charge of fuel. They have surmounted this detail in rather an ingenious fashion. An overhead poppet valve is used for the exhaust, as shown in the sketch. Its tappet is made in two portions, screwed together; the upper part is squared, and passes through a square hole in a plate which is rotated by a control linked to the throttle. As the throttle is closed, the tappet or push-rod is lengthened, so that the exhaust valve is held open longer, and a larger proportion of the scavenging charge of air escapes from the cylinder. In other words, the patent consists of a valve gear with a timing which can be varied from the saddle.



G. W. Lynn and F. J. Fison's two-stroke engine. No. 136,879. 19/12/18.

A Compact Kick-starter.

Signor Garelli, of Milan, offers a modification of that type of kick starter in which the toothed quadrant actuates a pinion loosely mounted between the gear

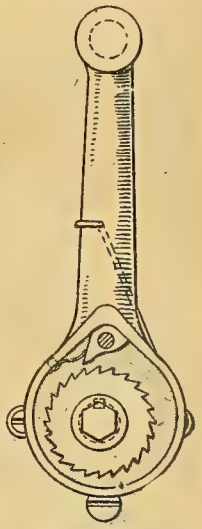


A. Garelli's kick-starter. No. 126,621. 3/5/19.

wheels on the secondary shaft of the gear box. As shown, the spindle of this quadrant is parallel to the gearshafts, and the helical teeth on the side of the loose pinion engage helical teeth on the side of a secondary gear wheel.

Simplifying the Starter.

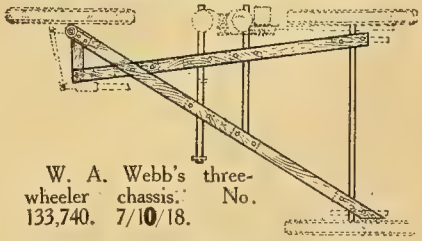
Mr. T. L. Williams has protected a very neat ratchet device for use on kick or handle engine starters. The drawing is practically self-explanatory. A ratchet wheel is concentrically mounted on the shaft which it is desired to rotate. This ratchet lies within a circular recess formed in the end of the kick lever, but this recess is eccentric in relation to the shaft. The pawl is mounted inside the recess, and, as shown, is clear of the ratchet in the idle position, and is also cleared if a back fire occurs. A useful device where overall width is a consideration.



T. L. Williams's kick-starter ratchet. No. 134,990. 4/12/18.

Three-wheeler Construction.

I thought it was impossible to devise anything new in the layout of a three-wheeler frame. We have had the one-wheel-astern and the one-wheel-ahead type, and the sidecar. But I do not remember having seen anything like Mr. Webb's proposals before. They are, of course, tantamount to a sidecar in general

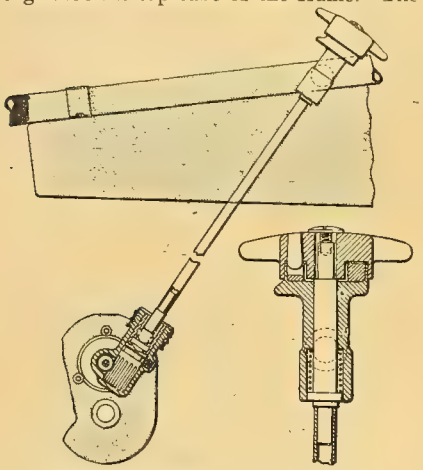


W. A. Webb's three-wheeler chassis. No. 133,740. 7/10/18.

effect, but the departures are by no means without interest. The chassis is far less lobsided, and the cross stresses are reduced. Moreover, side-by-side seating is obviously suggested, and a wooden frame is a cheap possibility. As the plan view makes clear, the front wheel is not mounted in forks, but on a stub axle on motor car lines, and is operated by a gear and wheel. Mr. Webb has tackled the sidecar afresh, as a distinct proposition, ignoring its evolution from a bicycle and a detachable fitting. It is true he suggests as an alternative that his chassis might be run broad end foremost, but the other notion appeals more.

A Neat Gear Control.

The next patent covers the very neat gear control fitted to the Velocette two-stroke. For those readers who have not seen it, I should explain that the sliding dog clutch of the gear box is fitted at one end with a circular rack, which is operated by a pinion on the lower end of the straight gear control rod. The "handle end" of this control rod is a disc with a "detent" or tooth on its underside; this tooth engages with the notches of a ring-shaped quadrant formed in the bracket protruding from the top tube of the frame. The

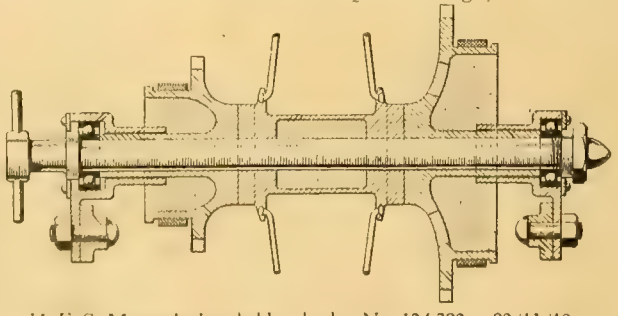


Veloce, Ltd., and P. J. Goodman's gear control. No. 137,186. 20/3/19.

gear control rod is coupled to the gear box by a universal joint which is telescopic and embodies a spring. The whole device is extremely simple, practical, and cheap to make.

Detachable Wheel for Morgans.

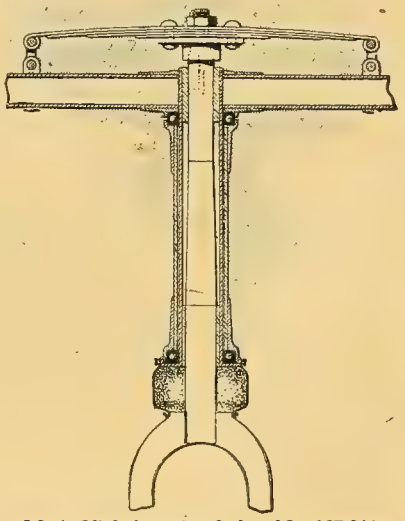
From Mr. H. F. S. Morgan's latest patent, I presume that his famous runabout will in due course be equipped with a detachable rear wheel. Cages in the rear forks contain ball bearings, mounted in housings which terminate in tubular sleeves, projecting inwards. Similar sleeves of smaller diameter project outwards from the two chain sprockets, so that these sleeves support the sprockets when the knockout axle is withdrawn. The drop-out rear wheel just fills the space between the two sprockets. The drive passes from the wheel to the sprockets as follows: On the inner face of each sprocket is a rectangular groove, machined across a diameter, and chamfered for easy engagement. A rib or dog of the same shape is machined on each end of the wheel hub. The knock-out spindle is threaded through the assembly and suitably locked. If the axle is freed and withdrawn the wheel can be slid out, leaving the sprockets *in situ*. To replace, the driving dogs are registered, the wheel inserted, the dogs turned into the horizontal position to take the weight of the wheel, and finally the axle is threaded back and the nut secured.



H. F. S. Morgan's detachable wheel. No. 134,390. 28/11/18.

Simplified Fork Springing.

A decidedly interesting spring fork is shown; the idea is M. Violet's, and it is given prominence in acknowledgment of its novel simplicity. It is a telescopic fork and the telescopic actions and re-

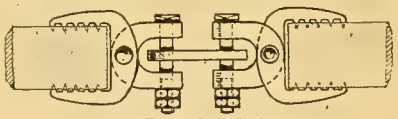


M. A. Violet's spring fork. No. 127,811. 1/6/18.

actions produced by shocks are damped by a pack of leaf springs affixed to the handle-bar by link work at each end. The central rod or sliding member of the fork may be square or polygonal, though this is not essential. A lubricator is fitted at the top, and a leather concertina device is fitted beneath the steering head to exclude dirt. I should much like to try this fork on the road.

A Dutch Belt Fastener.

I hate to show any want of sympathy towards inventors, but I do not love belt-fasteners as a class, and I like Mr. J.

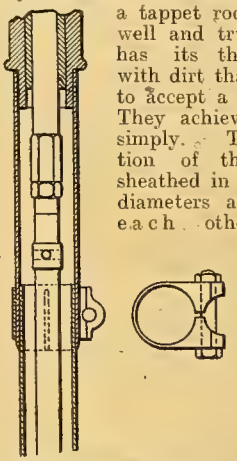


J. J. B. Bouvy's belt fastener. No. 133,925 28/1/19.

J. B. Bouvy's less than most. When a belt fastener is behaving itself it is out of mind. Our business relationships with them are always strafes; so no motor cyclist can do justice to their merits. Mr. Bouvy has conceived an intense hatred of punches, knives, and boring tools, which, in his opinion, weaken the belt so that it pulls through, and has to be shortened. Consequently, he eliminates the usual fastener bolts, and substitutes the fearsome saw-toothed pincers shown in the sketch. Of course, I have not tried this fastener; but in all respect, I suggest that Mr. Stanley and the Forward people might nurse the Dutch market, seeing that Mr. Bouvy hails from Dordrecht.

Enclosed Tappet Rods.

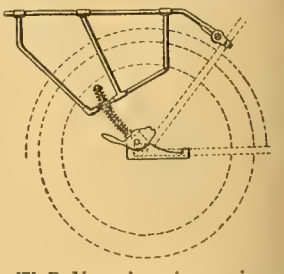
Humphries and Dawes, in conjunction with Mr. C. H. Sims, are out to protect us from the rage which arises when we try to secure a delicate adjustment of a tappet rod, which is either well and truly rusted up, or has its threads so choked with dirt that we are tempted to accept a makeshift setting. They achieve this ideal very simply. The business portion of the adjustment is sheathed in two tubes of such diameters as to slide within each other. Adjustment complete, the tubes are set to cover the parts, and a spring clamp is bolted round them at the point where they overlap. At the present moment I own two tappets similar to those shown in the drawing, but minus any sheathing. When they were new, it was a job to shift them as they rusted home; I always needed a good pair of gaspliers to hold the pushrod, and a well-fitting open-ended spanner to grasp the tiny nut. After 10,000 miles the adjustment ceased to hold, because the screwing action over threads containing road grit abraded the pitch. Mr. Sims probably owns a sister engine, and has allowed it to stimulate his brain.



Humphries and Dawes and C. H. Sims's valve gear. No. 136,386. 20/2/19.

Springing the Carrier.

It is unquestionably both difficult to design a good spring frame, and expensive to manufacture one. Sundry designers have already endeavoured to outflank these twin problems by improving the suspension of a saddle on a rigid frame. Mr. W. P. Young completes their coward's castle by devising a most taking



W. P. Young's spring carrier.

spring carrier, which must certainly be advertised as the "Flapper's Joy." The sketch is self-explanatory, save that I must draw attention to the cam plate beneath the springs. This enables the insulation to be adjusted for successive inamoratas.

ENGLAND v HOLLAND INTERNATIONAL RELIABILITY TRIAL

HOLLAND WINS THE THIRD ANGLO-DUTCH COMPETITION.

Trophy known as the "N. M. V. Beker," now the Property of the Country of its Origin.

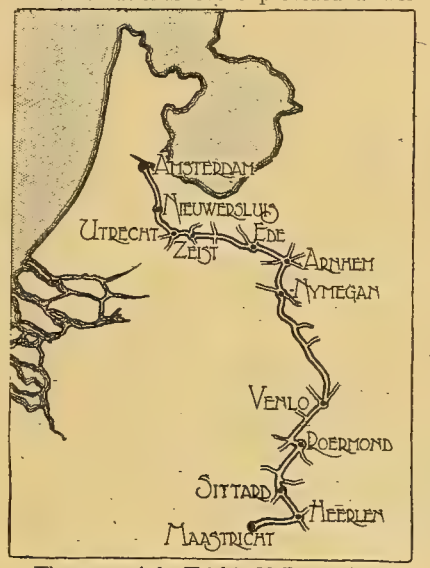
LAST Saturday the fates decided that the thrice run trial for the "N.M.V. Beker" should be a win for the sporting Dutchmen. Thus the cup becomes the property of the country of its origin.

The Dutch team won by 46 marks, losing a total of 234 against the 281 lost by the English team. Debited to Holland's team there were four stops, while all the British team, except one, made non-stop runs. The unfortunate Englishman was H. Colver (Matchless), who rode in the place of C. R. Collier, and who lost 135 marks.

Only two competitors had entirely clean sheets, England and Holland sharing in this honour: J. A. Newman (Sunbeam) being the English rider, and J. H. P. Jansen (7-9 Harley-Davidson), the fortunate Dutchman.

The Deciding Contest.

It was a happy band of motor cyclists that crossed from Harwich to Antwerp on Tuesday of last week. Their ultimate destination was Maastricht, the starting point of the third International Trial, England v. Holland. Additional interest was vested in the event by reason of the fact that both Holland and England held one share in the cup presented by Messrs. Ferwerda and Citroën in 1912, and success in the event rejuvenated since the war settled the final destination of the trophy. So many trials having been arranged in England during 1920, and the F.I.C.M. Grenoble Six Days Trial having failed to attract a representative British industry, this International event provided a welcome change from the ordinary run of contests. On the way to the mouth of the Scheldt, a Marconigram was despatched from the s.s. *Antwerp*, conveying greetings to the Dutch Club from the British riders aboard. It was a curious coincidence that, travelling by the same boat, was the team of British pedal cyclists selected to represent the home country in the Olympic International events at Antwerp. A photograph was taken by *The Motor Cycle* operator of the group of cyclists and motor cyclists on the upper deck.



The route of the Trial in Holland, which took place last Saturday.

Arriving at Antwerp after a good crossing, the machines were disembarked by rope slings what time the riders stood by with anxious eyes. Customs formalities took some considerable time, no assistance being rendered by the A.C.U. either here or at Harwich, which was the subject of much bitter comment. So much time was lost that the idea of continuing that afternoon over the Belgian border was abandoned, and the night was, therefore, spent in Antwerp.

A Sporting Dutchman.

Next day proved wet, yet not sufficiently to deter the sporting Dutch motor cyclist J. H. Neninhys from riding his N.U.T. machine to Antwerp in order to pilot the Britishers across Belgium. This good sportsman's action was greatly appreciated, and at 11 a.m., rain still falling fast, he led the way *via* Malines and Louvain. Quite naturally, the many traces of war proved a source of interest to the riders. Active work is in pro-

English and Dutch riders by the Canal, Maarsen. E. A. Edwards (3½ N.U.T.) and L. J. van Haren (2¼ Douglas), incidentally both reserve riders.

Near Utrecht. G. Smith (3½ Sunbeam), who, with L. Hunse (4 Wanderer), led their fellow competitors.

Near Ginkel Two British machines in opposing teams—a 3½ N.U.T. and a Douglas

gress in restoration—in fact, a genuine impression of activity was left upon the minds of the riders. The roads, however, were so bad that comparatively little attention could be paid to the scenery; it was bump, bump all the time over stone setts, only one short stretch of macadam road being encountered. Through St. Trond and Tongres the riders journeyed to Vise and, extraordinarily enough, passed, without knowing it, the Belgian frontier station. The officials are usually most wary, and how everybody passed through to the Dutch *douane* is beyond comprehension. Here no delay was experienced, but the sidecar drivers had to return to the Belgian frontier to get their papers signed, so that a reclaim could correctly be lodged for the £20 deposit paid. Arrived at Maastricht, the members of the Nederlands Club were met in force, and, clad in their dust begrimed clothes, the riders were forthwith led to the ancient Town Hall for the official reception accorded by the burgomaster, Mr. Chas. von Oppen. His private room was packed to overflowing as he welcomed first in Dutch and then in English the sixty or seventy riders and officials congregated. This honour was greatly appreciated, and the thanks of the British riders were conveyed by Mr. Geoffrey Smith, Editor of *The Motor Cycle*, who had been previously elected the captain of the British team.

Excellent Arrangements.

Then followed the second demonstration of the wonderful organisation notable throughout the trial by the Royal Dutch Motor Cyclists' Union. A book of tickets was handed to each rider, showing hotel arranged, price, all meals, garage, etc., with tear-out slips which themselves acted as an itinerary of the arrangements. Moreover, every bill had been paid in advance, the total amount shown on the front—averaging about forty gulden—being shown on the cover, which amount was refunded *via* the Auto Cycle Union to the Royal Dutch M.C.U. Then followed the first of a series of dinners in real Dutch style.

The Grabal Garage was full to overflowing on Friday, the Dutch riders for the most part having American machines, the British riders being mounted on all British mounts of a variety of makes, with the exception of one reserve.

After a preliminary look round the machines after their short yet shaky trip from Antwerp, a move was made to Valkenburg, in the Province of Limburg, where lunch was taken, M. Nic Jannink (the sporting president), E. J. Maas (the treasurer), and Mr. L. G. Zegers Veeckens (the secretary) being present. Mr. Zegers Veeckens proved a very cheery soul and an indefatigable worker, and earned the warmest praise from the competitors. From one o'clock till after four the lunch was in progress, and a jovial affair it proved. Very tired, the riders then visited caves for which Valkenburg is famous. Walking for nearly half a mile underground amidst rocks the Britishers enjoyed a weird and novel experience in the pitch black grotto. The long line was headed by a brass band and men carrying lanterns, and the procession—not by any means a silent one!—will long be recalled by those of the party.

En route to Holland. Pavé at Malines, Belgium.

Supper timed for 6.30 was abandoned by the Britishers, who were incapable of another repast. Consequently, they wended their way back to the garage at Maastricht, replenished the tanks, and affixed the number plates, each set of which were handed over in a neat cardboard box, together with route and control cards.

Extraordinary keenness was shown by both Dutch and British riders, nothing was left to chance. Hunse had the valves of his Wanderer out for cleaning, and nearly all cleaned out the carburetters and examined the plugs. Crosswaithe (James sc.) found a damaged washer in his gear box, and had another made at the official garage Grabal. At the last moment the British team elected H. P. Lucas (8 Zenith), a reserve man, to fill the vacant position in Class B. By 9 p.m. all machines were in garage complete with number-plates ready for the start on the morrow, sundry details on the extraordinarily complete route card having been explained.

A Non-stop Trial.

The total course measured 292.9 kilometres, divided into three sections, and the speeds varied from thirty to thirty-five kilometres per hour (18¾ and 22 m.p.h.) for the various sizes of engines. It was a non-stop event throughout, though provision was, of course, made for possible delays at railway crossings.

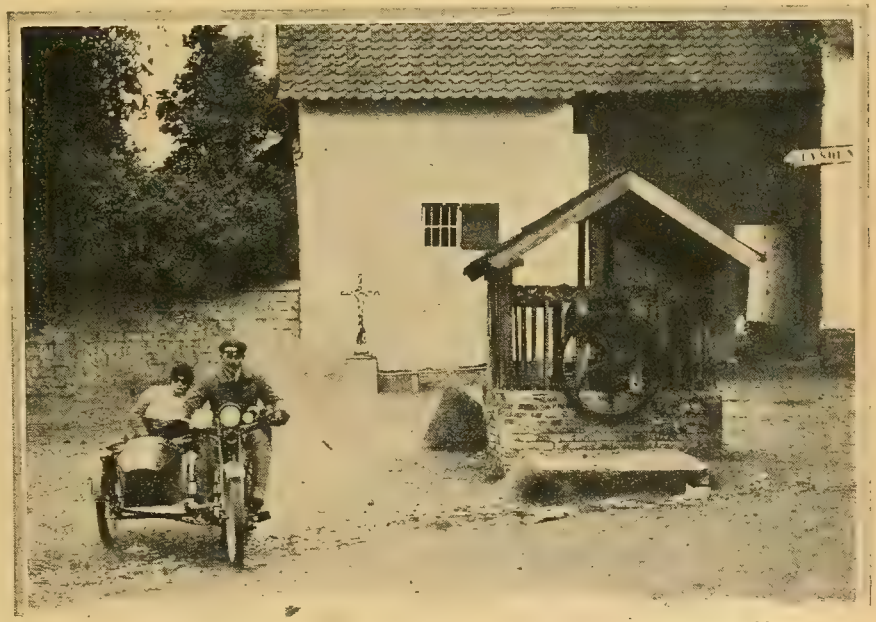
At the very outset on Saturday, the 7th inst., an opportunity of losing marks was provided, for sixty seconds were allowed each rider in which to get his engine running.

At the start at 6.30 a.m. some confusion was caused by the absence of watch cases; they arrived but five minutes prior to the start. All got away well in favourable weather, and commenced with a curious course to the south-west of Maastricht. Very tricky the bends proved, and arrows were not too plentiful. It was too early for the villagers, who assisted later to point the way. Ellis (Matchless sc.) went off the route, and was nearly up to the German frontier before he discovered his mistake. Lt. Kidstone (Sunbeam) found that his watch gained time, and soon he overhauled the leaders, G. Smith (Sunbeam), England, and Hunse (Wanderer), Holland.

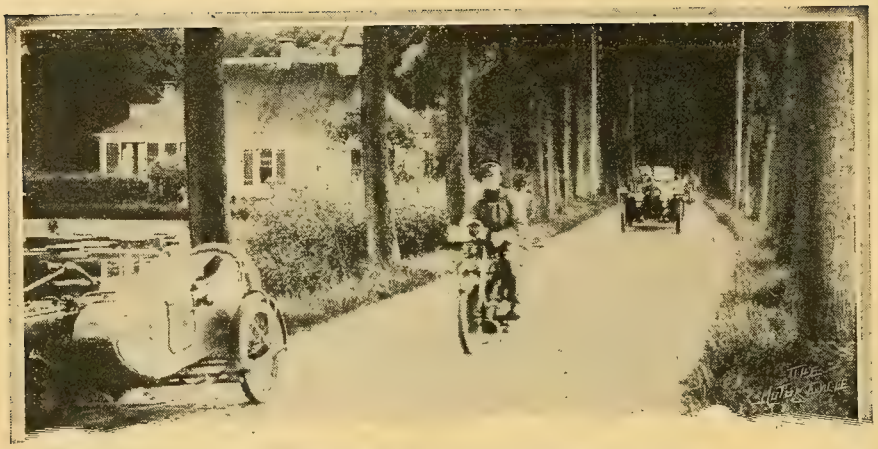
Early Troubles.

Another Matchless rider was unfortunate, for Colver, who took C. R. Collier's place in the team, broke a chain. But the Dutch team's ranks were also being thinned, one suffering a puncture and another plug trouble. Through remarkably picturesque scenery the route twisted first this way and then that, but always over passably good macadam roads, much to the competitors' glee. In one town rejoicing in the name of Sittard, some very bad *pavé* was crossed, but macadam roads were again the order. As the procession proceeded, official cars, which seemed to be legion, would speed past with open exhausts ready for the secret checks. There were no fewer than seven of these, besides three stated controls, and herein, we think, the Dutch club made a mistake, for secret checks place far too great a factor on the reliability of the watch instead of the reliability of the machine. After such a long distance the run positively became a bore due to a constant eye on the watch, and the difficulty in deciding where one actually was. Railway crossings caused temporary halts, perhaps naturally, as they are so numerous in the Netherlands. The first stage ended at Veuls (111 kilometres), and most reported non-stops to this point. The remarkably regular running of Gibb (Douglas), Newman (Sunbeam), Hugh Gibson (Clyno), and Don (Zenith) was interesting to observe. No more careful quartette could be imagined.

The second stage was to St. Anna (fifty-nine kilom), a pretty stretch of country



H. Fels (7-9 Harley-Davidson), one of the Dutch amateur riders, in Grondveldt.



J. A. Newman (Sunbeam) in the vicinity of Amsterdam.

which, however, could not be enjoyed to the full. At St. Anna the ferry was used to cross the water, and due to this and another ferry over a tributary of the Rhine, coupled with railway crossings, it had been arranged that the run to Arnhem should not be timed.

The third, last, and prettiest section of this enjoyable and sporting trial was from Arnhem to Amsterdam (111.9 kiloms). The Dutch riders rode magnificently. It was noticeable how dexterously they handled their British and American mounts. A Beardmore-Precision, a Metro-Tyler, a Cedos, and a James formed a quartette of most reliable British machines in the Dutch team, checking at each control most regularly. Two or three Douglas riders also kept splendidly to time, and generally it can be stated that reliability was the outstanding feature, marks lost being due to being early or late at controls. Dutchmen consider it a double sin to be a minute too early, so penalised riders two marks for every minute early, and only one for every miuute late.

In Utrecht crowds as usual on these occasions lined the streets. Todd (Reading-Standard), a reserve British rider, took a toss on one of the many acute bends.

The Final Section.

Delightfully picturesque Dutch scenery was enjoyed about Nieuwersluis—where the road crossed and recrossed when it did not run actually beside the Merwede Canal. There were occasional hold ups while sailing barges and steamers passed through the swing bridges. A goodly concourse of interested people gathered at the Stadium to witness the finish, most of the riders receiving an ovation as they clocked in as regularly as clockwork. At the conclusion of the run no one could forecast the result, for the complicated series of checks entailed much work for the willing Dutch officials.

The British team which competed, was composed of the following riders :

AMATEURS.—G. Smith (3½ Sunbeam), Lt. G. P. Glen Kidston, R.N. (3½ Sunbeam), E. A. Edwards (3½ N.U.T.), F. A. Hardy (5 Zenith), F. Dover (4 Triumph), H. P. Lucas (8 Zenith), H. Boynton (5-6 James sc.), C. Crossthwaite (5-6 James sc.), F. J. Ellis (8 Matchless sc.), and S. Barron (7-9 Harley-Davidson sc.).

TRADE RIDERS.—W. B. Gibb (2¾ Douglas), J. A. Newman (3½ Sunbeam), Hugh Gibson (2½ Clyno), Kaye Don (6 Zenith), L. Newey (6 Ariel), P. W. Moffatt (4 Douglas), W. Pratt (6 Matchless sc.), H. V. Colver (8 Matchless sc.), E. B. Ware (8 Matchless sc.), and J. W. G. Todd (8 Reading Standard)

H. Gibson (2½ Clyno) near Zeist.

The machines used by the Dutch team and its reserves included four Douglas, two James, nine Harley-Davidson, three Indian, two Simplex, and one each Wanderer, Bianchi, Sarolea, Henderson, Royal Enfield, Metro-Tyler, Blackburne, Cedos, Excelsior, and Martinsyde.

CURRENT CHAT (Continued from p. 185)

The Degory Carburetter.

Readers have manifested a keen interest in the Degory carburetter with which a reader recently claimed a petrol consumption of 113 m.p.h. on a Scott. In this week's issue (page 184) we are able to give details to this no-jet instrument.

Motor Cycle Detectives.

Announcements have appeared in various journals concerning the recent decision to employ motor cycles in the detective branch of the Metropolitan Police.

We recently had an interview with one of the heads of the detective branch, who gave us a certain amount of information concerning this new departure, which is a further sign of the appreciation by the Government of the work which can be performed by motor cycles.

The machines employed are 4 h.p. Triumphs, and are reconstructed Army models equipped with comfortable sidecars. They are to be used in the Metropolitan police area, a district which extends over a far greater tract of country than most people imagine, having an average radius of fifteen miles.

These sidecar outfits will be extremely useful in taking detective officers to outlying districts, and will enable them to reach quickly the scene of any crime which may have been committed, and to facilitate the superintendence of those working under them.

Naturally, it would be unwise to deal in detail with the nature of the work these officers have to perform, so we give but a sketchy outline of their duties. The officers who are taking up the driving of these motor cycles are being instructed by the Public Carriage Department under Superintendent Bassom, who informs us that some are already becoming quite proficient, but, naturally, the time taken to learn properly varies considerably with each man. The men are instructed in theory as well as in practice, and are given a considerable amount of instruction in driving in London traffic. Superintendent Bassom informs us that the men are exceptionally enthusiastic.

The Late Captain M. A. J. Orde, R.A.F.

It is with very deep regret that we have to announce the death of Captain Michael A. J. Orde, eldest son of Sir Julian Orde, secretary of the Royal Automobile Club, who was killed while flying at Netheravon on the 5th inst.

His loss will be greatly felt by those who knew him. He was of a popular and generous disposition, and an exceptionally charming fellow. We extend our heartfelt sympathies to Sir Julian and Lady Orde in their irrevocable loss.

London to Holyhead Trial Results.

The awards for the Ealing Club's successful holiday event to Holyhead have now been announced. Maude's fifty guinea challenge shield, replica of same and gold medal, Rex G. Mundy (10 h.p. G.N.). Gold medals.—D. D. Tilt (4 Triumph), W. G. Boyer (5-6 Rover), A. G. Battley (4 Triumph), G. Nott (8 Matchless sc.), Mrs. Knowles (3½ Norton), P. Cunningham (3½ P. and M.). Silver medals: F. S. Spouse (10 T.B. cycle car), R. M. Knowles (3½ Norton), and T. J. Ross (8 Matchless sc.).

A BATTLE OF SPLIT SECONDS.

Duel between 350 c.c. and 500 c.c. Machines at Chatsworth Park.

NEVER before was such a scene witnessed in the historic park of Chatsworth as occurred last Saturday. In this sylvan setting, midst the oaks and elms, and to the music of the River Derwent, was held the open speed trials organised by the East Midland and Yorkshire Clubs. The meeting was most opportune, for hundreds of holiday-makers in the district took advantage of the afternoon's sport. At one period of the day there were 5,000 spectators present, and hundreds of motor vehicles of all descriptions, from baby two-strokes to Rolls-Royce cars, parked thickly near to the course. One adverse comment has to be made, and it may as well be made at the outset. The programme was inordinately lengthy. Eight solid hours of speed events are more than sufficient to tire the keenest enthusiast. It was satisfactory for the clubs to obtain an entry of 450, but if it desirable to attract so many entrants, why not start the trial earlier in the day? As it was, the last event on the programme took place close on 9 p.m.

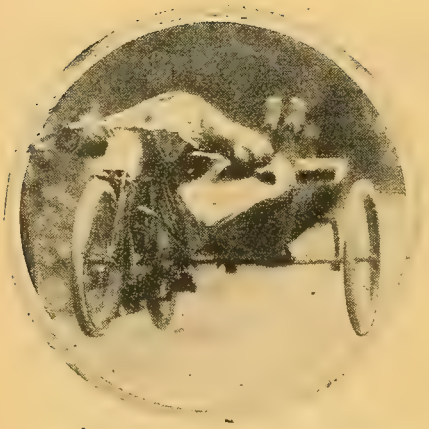
Wolverhampton Rivalry.

After a few events had taken place, it was obvious that the feature of the day was to be the tussle between A.J.S. and Sunbeam machines, class after class affording the public some fine duels between H. R. Davies and G. Dance. In Class 4, for sidecars from standing start, possibly H. R. Davies was seen at his best. Few thought that Geo. Grinton's time on the 7-9 h.p. Harley would be equalled, but immediately after the big sidecar had hurtled down the course Davies brought along his little 2¾ A.J.S. and sidecar in exactly the same time of 37⅘s., a fine performance that was applauded by the spectators and freely commented upon by many people.

Later in the afternoon Davies broke a valve, which unfortunately put him out of the running for subsequent events. But another A.J.S. rider, G. S. Boston, immediately showed what his little machine could do solo, and proved just as formidable in the solo classes as Davies had in the sidecar events. Of the Norton entrants V. Horsman made the best time, being only two-fifths of a second behind Dance (3½ Sunbeam), who attained officially the best time of the day. This was an extremely good performance, for, as is well known, Norton racing engines do not vary fundamentally from standard speed models.

As the afternoon progressed there was speculation as to whether Boston's figures would be improved. He had obtained 27⅕s. in two classes, and it was not until Class 19 was reached that Dance equalled that time. Of all the classes this one revealed the best riding,

A scene at the finishing point. G. S. Boston, with his A.J.S. sidecar, in Class 6.



A study of H. R. Davies, who made good speeds with his A.J.S. sidecar.

for Boston once more covered the course in 27⅕s., making three times in all. Horsman in ⅖s. more.

By the time the last class was reached these times had not been bettered, and as a final wind up to the long drawn out afternoon, Dance and Boston rode for the fastest time of the day. There was almost a hush at the finishing tape when Boston's machine was seen streaking down the course, and the general comment was as he flashed by that he had bettered his time of 27⅕s., but to the general disappointment a hitch had occurred in the telephone department, and his time had not been taken, thus necessitating another run down for him. A hum in the distance denoted that Dance had started on his 3½ h.p. Sunbeam, and in a few seconds he flashed by, just equalling the old times of Boston and himself—27⅕s.

"Fastest" Time of the Day.

Now would the little A.J.S. beat it? Opinion was divided, and incidentally a little problem also created in some people's mind. Must the "fastest time of the day" actually be so, in fact. If Boston failed to beat his own record of 27⅕s., would Dance obtain "fastest time of the day" with his 27⅖s? This was soon decided, for 27⅖s. was recorded for Boston a few seconds after he had flashed by. Dance, in consequence, obtained fastest time of the day, though his time had been equalled on three occasions by Boston. There need be no questioning the right or wrong of the case, however, for the last "event" to decide the tie for "fastest time," and the best time in this last duel was the deciding factor, anomalous as it may appear. The following are the results (length of course half a mile):

CLASS 1.—OPEN. SIDECARS UNDER 350 C.C. Standing Start.

		Time.
1.	George Dance (2¾ Sunbeam)	39⅘s.
2.	G. S. Boston (2¾ A.J.S.)	40⅖s.
3.	H. R. Davies (2¼ A.J.S.)	45⅗s.

CLASS 2.—MEMBERS. SIDECARS UNDER 600 C.C. Standing Start.

1.	H. R. Davies (2¼ A.J.S.)	39⅘s.
2.	V. Horsman (3½ Norton)	40⅕s.
3.	G. Dance (2¾ Sunbeam)	40⅗s.

CLASS 3.—OPEN. SIDECARS UNDER 750 C.C. Standing Start.

1.	H. R. Davies (2¼ A.J.S.)	38⅕s.
*	G. S. Boston (2¾ A.J.S.)	40⅖s.
*	G. Dance (2¾ Sunbeam)	40⅖s.

* Equal, 2nd place.

CLASS 4.—OPEN. SIDECARS, UNLIMITED C.C. Standing Start.

*	Geo. Grinton (7-9 Harley-Davidson)	37⅘s.
*	H. R. Davies (2¾ A.J.S.)	37⅘s.
3.	Geo. Stobart (5-6 James)	39⅖s.

* Equal for 1st place.

CLASS 5.—OPEN. SIDECARS UNDER 350 C.C. Flying Start.

1.	G. S. Boston (2¾ A.J.S.)	33⅕s.
2.	G. Dance (2¾ Sunbeam)	34⅖s.
3.	G. Cowley, senr. (2¾ A.J.S.)	47⅖s.

CLASS 6.—MEMBERS. SIDECARS UNDER 600 C.C. Flying Start.

1.	H. R. Davies (2¾ A.J.S.)	32⅘s.
2.	G. Dance (3½ Sunbeam)	33⅕s.
3.	G. S. Boston (2¾ A.J.S.)	33⅖s.

CLASS 7.—OPEN. SIDECARS UNDER 750 C.C. Flying Start.

1.	G. Dance (3½ Sunbeam)	32⅘s.
*	E. W. Walker (3½ Norton)	33⅕s.
*	H. R. Davies (2¾ A.J.S.)	33⅖s.

* Equal for 2nd place.

CLASS 8.—OPEN. SIDECARS, UNLIMITED C.C. Flying Start.

1.	G. Grinton (7-9 Harley-Davidson)	30⅘s.
2.	F. W. Dixon (7-9 Harley-Davidson)	31⅘s.
3.	G. Dance (3½ Sunbeam)	34⅘s.

CLASS 9.—OPEN. SOLO MACHINES UNDER 275 C.C. Standing Start.

1.	F. Porter (2½ Levis)	40⅘s.
2.	Mary C. Jennison (2½ Velocette)	45⅘s.
3.	J. S. Bennett (2½ Metro-Tyler)	50⅘s.

CLASS 10.—OPEN. SOLO MACHINES UNDER 350 C.C. Standing Start.

1.	G. S. Boston (2¾ A.J.S.)	33⅕s.
2.	G. Dance (2¾ Sunbeam)	33⅖s.
3.	F. Porter (2½ Levis)	40⅕s.

CLASS 11.—OPEN. SOLO MACHINES UNDER 500 C.C. Standing Start.

1.	G. S. Boston (2¾ A.J.S.)	32⅖s.
*	V. Horsman (3½ Norton)	33s.
*	G. Dance (2¾ Sunbeam)	33s.

* Equal for 2nd place.

CLASS 12.—MEMBERS. SOLO MACHINES UNDER 600 C.C. Standing Start.

*	G. S. Boston (2¾ A.J.S.)	32⅖s.
*	G. Dance (2¾ Sunbeam)	32⅖s.
2.	V. Horsman (3½ Norton)	33½s

* Equal for 1st place.

CLASS 13.—OPEN. SOLO MACHINES UNDER 750 C.C. Standing Start.

1.	G. Dance (2¾ Sunbeam)	33⅕s.
2.	H. R. Harveyson (3½ Indian)	36s.

CLASS 14.—OPEN. SOLO MACHINES, UNLIMITED C.C. Standing Start.

1.	G. S. Boston (2¾ A.J.S.)	32⅖s.
2.	G. Grinton (7-9 Harley-Davidson)	33⅕s.

CLASS 15.—OPEN. SOLO MACHINES UNDER 275 C.C. Flying Start.

1.	Fred. Porter (2½ Levis)	36⅘s.
2.	Mary C. Jennison (2½ Velocette)	40⅕s.
3.	J. S. Bennett (2½ Metro-Tyler)	42⅕s.

CLASS 16.—OPEN. SOLO MACHINES UNDER 350 C.C. Flying Start.

1.	G. S. Boston (2¾ A.J.S.	27⅕s.
2.	G. Dance (2¾ Sunbeam)	27⅖s.
3.	A. Hodgson (2¾ Douglas)	32⅕s.

CLASS 17.—OPEN. SOLO MACHINES UNDER 500 C.C. Flying Start.

1.	G. S. Boston (2¾ A.J.S.)	27⅕s.
*	V. Horsman (3½ Norton)	27⅖s.
*	G. Dance (3½ Sunbeam)	27⅖s.

* Equal for 2nd place.

CLASS 18.—MEMBERS. SOLO MACHINES UNDER 600 C.C. Flying Start.

1.	G. S. Boston (2¾ A.J.S.)	27⅕s.
*	V. Horsman (3½ Norton)	27⅖s.
*	G. Dance (3½ Sunbeam)	27⅖s.

* Equal for 2nd place.

CLASS 19.—OPEN. SOLO MACHINES UNDER 750 C.C. Flying Start.

1.	G. S. Boston (2¾ A.J.S.)	27⅕s.
*	V. Horsman (3½ Norton)	27⅖s.
*	G. Dance (3½ Sunbeam)	27⅖s.

* Equal for 2nd place.

CLASS 20.—OPEN. SOLO MACHINES, UNLIMITED C.C. Flying Start.

1.	Geo. Grinton (7-9 Harley-Davidson)	27⅖s.
2.	Geo. Dance (3½ Sunbeam)	27⅖s.
3.	H. R. Harveyson (7-9 Indian)	27⅕s.

CLASS 21.—OPEN. THREE-WHEEL RUNABOUTS. Standing Start.

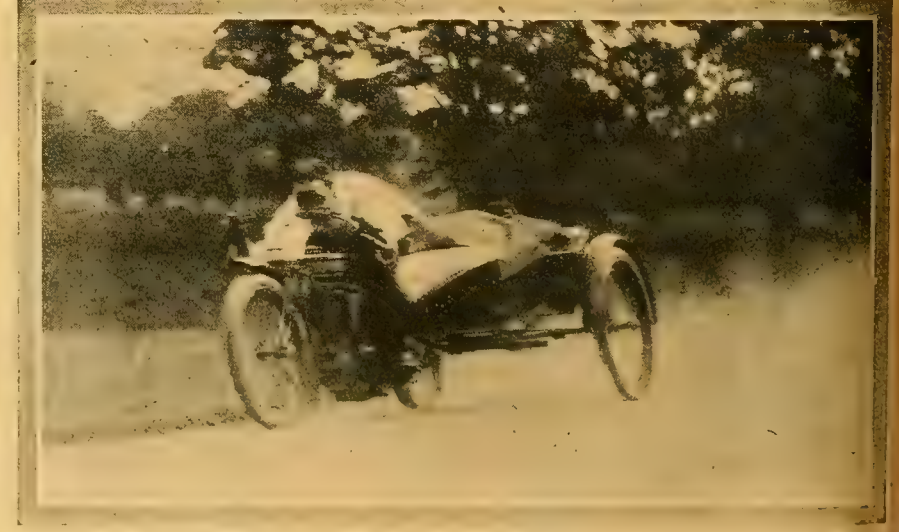
1.	F. W. James (Morgan)	44⅖s.
2.	W. Marriot (Morgan)	50⅘s.

CLASS 22.—OPEN. THREE-WHEEL RUNABOUTS. Flying Start.

1.	F. W. James (Morgan)	40⅘s.
2.	W. Marriot (Morgan)	43⅖s.

THE NEW SIDECAR TAXES.

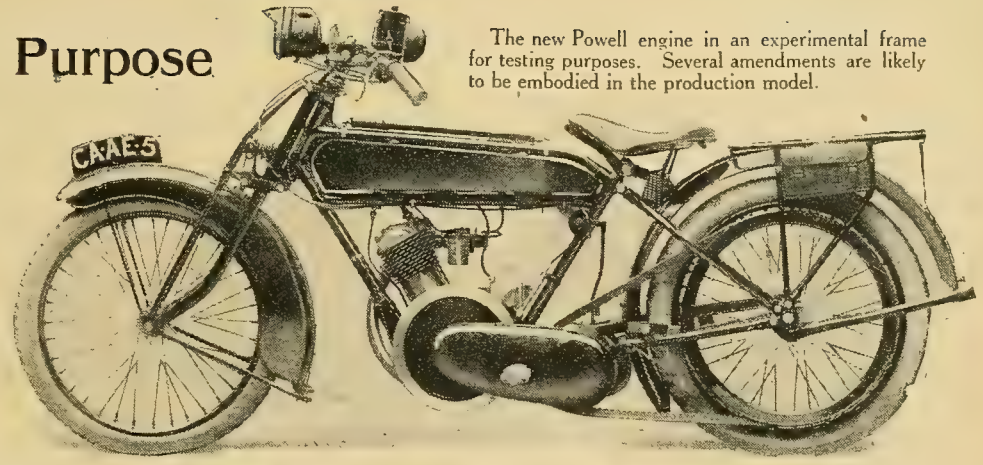
As announced in last week's issue, an amendment has been made in the sidecar taxes for next year. The interests of motor cyclists on the Motor Legislation Committee are represented by the A.C.U. and the Manufacturers' Union. On a recent occasion these two bodies suggested that lightweight sidecar outfits should be taxed £2 10s. This means 30s. for the motor bicycle and £1 for the sidecar. As previously announced, the heavyweight sidecar outfit is taxed £4, that is, £3 for the motor bicycle and £1 for the sidecar.



A Norton at speed. Victor Horsman, who put up very good performances, travelling at over 60 m.p.h.

A New Dual Purpose Machine.

The 4 h.p. Powell with Outside Flywheel.



The new Powell engine in an experimental frame for testing purposes. Several amendments are likely to be embodied in the production model.

FOR some months past we have been in touch with the well-known firm of Powell Bros., Ltd., the Cambrian Iron Works, Wrexham, who have been quietly developing a new line of business which takes the form of a 4 h.p. motor cycle. They are by no means newcomers to the field of internal combustion engines, though it was not until after the war that they decided to enter the lists as producers of a motor cycle.

Having secured as designer Mr. E. A. Burney, whose name is already well known in connection with the Blackburne and Burney machine, it is perhaps hardly surprising to find that the new engine is fitted with a large outside flywheel, but here the resemblance between the two engines ends, for many new and distinctive features are incorporated in the new Powell engine. Mr. Burney, who became a despatch rider in August, 1914, and ended his war-time career in charge of a repair workshop, had many opportunities of studying motor cycles under the hardest possible service, and, naturally, the results of his experience have been embodied in the new design.

The engine has a bore and stroke of 85 mm. and 96.5 mm. respectively (547.8 c.c.), and the cylinder is inclined forward at an angle of 30°. A detachable cylinder head is held down by four long studs, the cylinder itself being separately attached by nuts at the base of these studs.

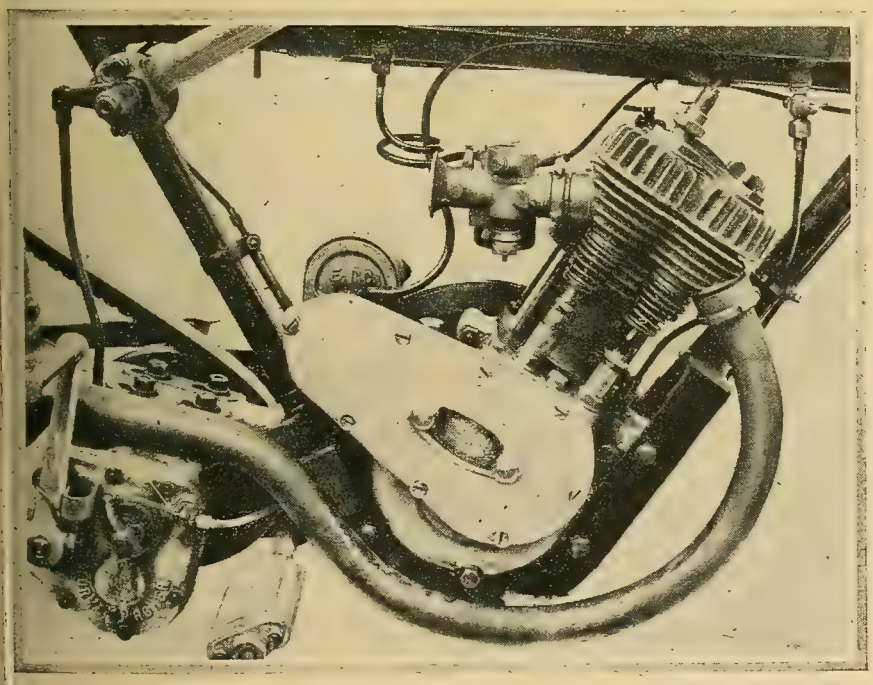
Sprocket Outside the Flywheel.

A one-piece hollow crankshaft is carried in very large Skefko ball bearings on either side, and the flywheel is fixed on to the shaft immediately outside the crank case. By using a short, large diameter hollow shaft torsional oscillation is minimised, and the primary drive is rendered extremely accessible by its position on the outside of the flywheel. A split big end (1⅛in. diameter × 1½in. long) is employed, and the patented method of lubrication for this part is most interesting. The leading face of each crank web is grooved, the groove becoming gradually deeper until it reaches the inside of the hollow crank pin, so that oil is flung into the pin by centrifugal force. It then reaches the bearing *via* a hole drilled radially in the crank pin, and is distributed over the surface by two grooves cut in the crank pin and forming an inclined angle of 60°. These grooves have a maximum depth at the hole and taper away to nothing, while there are no grooves in the bronze bearing. Half-inch diameter hollow adjustable tappets, working in cast iron guides, operate the side-by-side valves, and the arrangement of cam and distribution gear deserves special attention. A single cam controls the lift of both inlet and exhaust valves, while specially formed rockers are relied on to provide the necessary variation in periods. Meshing with the cam wheel is a large bronze intermediate wheel, which in turn drives a steel wheel on the magneto spindle.

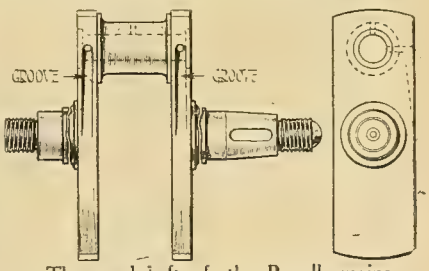
Lubricating the Timing Gear.

The cam and rockers are provided with special means of lubrication, and the intermediate wheel bearing is lubricated by oil thrown off the cam wheel, the gear teeth of the former being narrower by ⅛in. than the latter to facilitate this arrangement. A hardened thrust plate locates the loose gear wheels, and a single cover plate encloses all the timing gear.

It will be gathered from the above that the magneto is carried on the crank case.



Valve side of the engine designed by Mr. E. A. Burney for the Powell motor cycle. Observe the cradle supporting the unit, which permits the engine, complete with magneto and equipment, to be removed from the frame in ten minutes.



The crankshaft of the Powell engine, showing the oil grooves in the webs. There are also oil grooves in the centre of the crank pin from the oil exit, so arranged that a capillary action is produced in addition to that of centrifugal force, combining to make a simple but very efficient lubrication system at the "big end."

A New Dual Purpose Machine.—

A special bracket is, in fact, cast on the base chamber behind the cylinder, and the magneto is held in position by a single large stud.

Two points immediately strike the observer. The engine is remarkably clean as regards oil leakage, and it has no awkward crevices or excrescences to collect mud, every corner being carefully rounded. Probably the disposition and arrangement of the large ball release valve has much to do with the fact that the engine keeps so clean.

Before passing on to the frame and transmission, one other important point must be mentioned. Owing to special construction, it is claimed that the engine unit complete with magneto and carburetter can be removed from the frame in ten minutes. This is largely due to the method of engine fixing, for the unit is carried by plates, permanently fixed to the frame and extending from front to back so as to form in effect a loop frame.

Chain-cum-belt Transmission.

Transmission is by chain and belt through a Sturmey-Archer three-speed gear. The frame has a slightly sloping top tube curved downwards at the rear, and a two-gallon petrol tank is fitted. Oil is pumped to the engine by a plain enclosed oil pump, and the frame details follow standard lines, though only the highest class of fittings are employed.

On the road a curious and desirable combination of effects is noticeable, for the engine combines the slow tick over and excellent pulling powers, which go with a large outside flywheel, with the freedom and "revving" qualities of the more usual inside flywheel type.

A very fair turn of speed is available in spite of the fact that the machine which we handled is the first of its type, and remains unfinished in certain details, having fired for the first time a day or two before our trial.

It is expected that the new machine will be in production in time for the next Olympia Show, and we feel justified in prophesying a rosy future for such an admirably designed motor cycle.

Two-stroke Takes Long Distance Records.

350 c.c. Alecto at Brooklands averages over 41 m.p.h. for Twelve Hours.

AFTER the performances of the simple two-stroke in post-war reliability trials, and its success in winning *The Motor Cycle* trophy in the T.T., it only remained for someone to break records on Brooklands firmly to establish this type of engine for every purpose.

On Tuesday of last week Stanley Gill, riding a 350 c.c. Alecto, broke, among others, the ten, eleven, and twelve hours records in Classes B, C, and E, and the nine-hour record for Class B.

The following are new times and speeds set up by the Alecto, and also the figures of the records broken:

Nine hours.—383 miles 764 yards = 42.60 m.p.h. in Class B, beating F. A. McNab's record of 375 miles 1,668 yards of May 27th.

Ten hours.—421 miles 758 yards = 42.14 m.p.h. in Classes B, C, and E, beating McNab's May record in the first mentioned class, Pullen and Green Rudge record of 1913 41.94 m.p.h. in Classes C and E.

Eleven hours.—459 miles 1,165 yards = 41.78 m.p.h. in Classes B, C, and E, beating McNab's speed by 1.56 m.p.h.

Twelve hours.—500 miles 951 yards = 41.71 m.p.h. in Classes B, C, and E.

400 miles.—9h. 31m. 29⅘s. = 41.99 m.p.h. Class B, previously held by McNab = 41.94 m.p.h.

450 miles.—10h. 46m. 42⅕s. = 41.75 m.p.h. Classes B. and C. Previous record, 11h. 10m. 8⅘s.

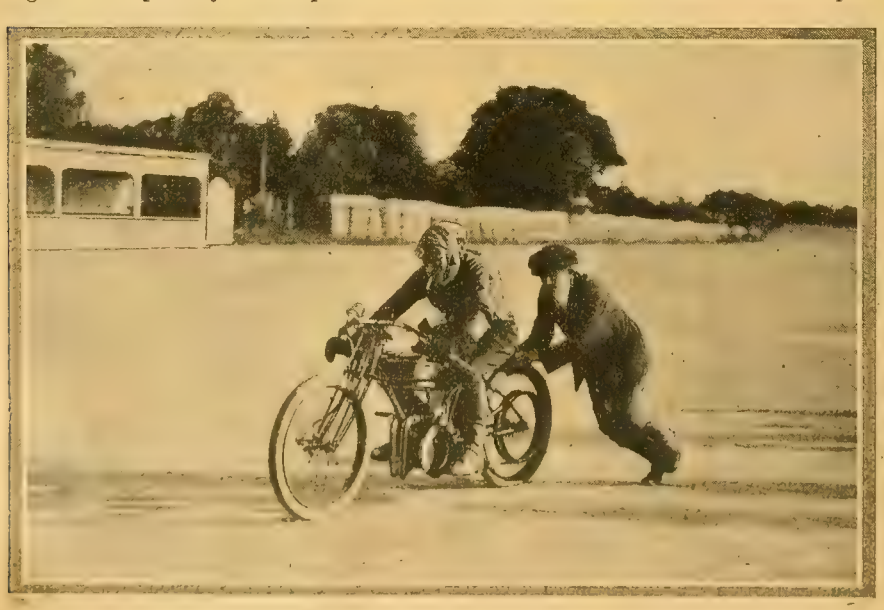
500 miles.—11h. 59m. 15⅘s. = 41.71 m.p.h. Classes B, C, and E.

Classes C and E are for 500 c.c. and 1,000 c.c. machines respectively, so Gill's performance on a single-cylinder air-cooled two-stroke is really remarkable.

The bore and stroke of the Alecto engine are 76 mm. respectively, the capacity being 345 c.c. The equipment of the record-breaking machine included Brooks saddle, Amac carburetter, C.A.V. magneto, Dunlop ¾in. belt, and Lodge plug, while Shell spirit and Castrol oil were used.

Worthy of special mention is the performance of the Hutchinson tyres used on the record-breaking run. The same tyres were used throughout, and one was by no means new. The official timekeeper, Mr. A. V. Ebbewhite, informs us that he has timed every motor cycle record on Brooklands, and he does not recall any similar performance by a pair of tyres.

We congratulate all concerned, especially Stanley Gill as the rider, and Cashmore Bros., the makers of the first two-stroke to secure long-distance records on Brooklands.



Stanley Gill, who, on a 350 c.c. two-stroke Alecto, broke several records on Brooklands last week.

A SCOTTISH TWO DAYS TRIAL.

A VERY excellent idea is to be carried into effect in the forthcoming Scottish Two Days Trial to be held in September next, as already announced in this journal. The D.R. Engineering Company of Dunfermline and Edinburgh have offered a special prize for any team of three riders nominated by an agent. The conditions are as follows:

(1.) The machines need not necessarily be of one make, but must be makes for which the agent holds an agency or sub-agency.

(2.) At least one rider in each team must be nominated by the agent.

(3.) The agent may enter as many teams as he likes.

(4.) No rider may be nominated by more than one agent.

This arrangement, we consider, is a most excellent and original idea, whereby the small country agent will be given an opportunity of distinguishing himself to the same extent as will a larger agent.

Entries for this trial should be sent in as soon as possible to Mr. Graham Davidson, hon. trials secretary, Edinburgh and District Motor Club, Ltd., 6, Castle Terrace, Edinburgh.

No ballot is to be held for riding position, but competitors will be despatched in the order in which their entries are received.

DEATH OF BLACK PRINCE DESIGNER.

We regret to have to report the death last week of Ernest William Cameron, the designer of the Black Prince single plug flat twin and the Black Prince Runabout. The deceased was found dead in a wood near his home at Askern, where, during temporary insanity, he had hanged himself.

Acmeisms (No. 14)

"Earnestness is ever deeply solemn." (Jane Eyre).

Carry this into your motor cycling world, have you noticed the promises and announcements of many new comers? How often have these promises been kept?
The "Acme" is a new comer, a mount of distinction, a machine to be proud of.
Solemn is my promise and earnest my intention that the "Acme" shall always be to every rider "The Machine of no regrets."

8 h.p. Twin-cylinder.
Three-speed Gear Box.
28" x 3" Detachable Interchangeable Wheels.
Permanent Sidecar connections.
Coach-built Sidecar.
Cantilever Springing, etc.

3½h.p. 1914 Rover 3-speed Clutch Model, good condition, all accessories; £50.—C. Warren, Wilburton, Cambs. [9509

ROVER 1914 Coachbuilt Combination, 3½h.p., 3-speed clutch, lamps, tools; £65.—89, Southwark Bridge Rd. Hours 8.30-5.0. [948

ROVER 3½h.p., countershaft, all-chain drive, unused, 7½% below list; owner must sell.—Box 391, c/o *The Motor Cycle.* [1936

1919 Rover Combination, 5-6h.p. J.A.P., splendid condition, grand hill climber; bargain, £160.—Osbaldeston, Pigbeth, Walsall. [9844

1920 5-6h.p. Rover, with Rover bulbous sidecar, in stock at list; exchange Morgan, etc.—2, Nightingale Rd., Lower Clapton, N.E. [1975

ROVER 3½h.p., 3-speed and clutch, 1914, perfect running order, good tyres; bargain at £50.—Granger, Icewell Hill, Newmarket. [1980

5-6h.p. Rover Combination, 1917, 3-speed, chain drive, first-class condition; £140.—Turner's Motor Works, Curzon Rd., Ealing, W.5. [2129

3½h.p. Rover, Bosch, B. and B., 2-speed and clutch, sound condition, tyres excellent; £50, nearest.—Write 91, Hurst Rd., Eastbourne. [9815

1919 (Dec.) Rover 3½h.p., 3-speed, 1920 Canoelet sidecar, combination as new, small mileage; £140.—5, Laurels, Ulverston, Lancs. [X8197

3½h.p. Rover, 3-speed, clutch, all accessories, condition perfect, very smart mount; best offer over £50.—Proctor, 33, Alexandra Rd., Hitchin. [X8010

1916 3½h.p. T.T. Rover, Philipson pulley, equipped, fast, economical, excellent condition; 65 gns.—Loweth, 6, Mount Pleasant Rd., Ealing. [1475

MOTOR CYCLES FOR SALE.

Rover.

1918-19 3½h.p. T.T. Rover, Philipson pulley, excellent condition; £95.—R. Bamber and Co., Ltd., 2, Eastbank St., Southport. Tel.: 607. [1123

ROVER, 1920 3½h.p., lamps, tools, only done 400 miles, in splendid condition; £135, or near offer.—Mattock Motor Co., Mattock Lane, Ealing, W.5. [9587

ROVER 5-6h.p. 1920 Combination, horn, speedometer, lamps, etc.; £180; cash, credit, exchange.—Service Co., Ltd., 292, High Holborn, W.C.1. [1238

ROVER, T.T., 1919 (November), all accessories, spare valve, long plated exhaust, fast, and in new condition; £98, or nearest.—20, Mount Pleasant, Redditch. [9428

1915 Rover Combination, 4h.p. wind screen, lamps, tools, etc.; £85; privately owned.—Particulars from Reliance Motor Works, St. Cross Rd., Winchester. [9720

1920 (July) Rover 6h.p. Combination, C.A.V. lighting (accumulator), horn, luggage grid; £225.—Morley, Ranmore, Beverley High Rd., Hull. [X8196

ROVER, 1914, 3½h.p., 3-speed, splendid order, low mileage, speedometer, horn, lamps, tools.—Robinson, Old Hall, Little Budworth, Tarporley, Cheshire. [1392

ROVER, 1914, 3½h.p., 3-speed S.A., nearly new Canoelet sidecar, all lamps, speedometer, good condition; £85.—Palmer's, Albion Place, Wisbech. [1395

1912 Rover 3½h.p., Bosch, B. and B., 3-speed, clutch, perfect order; sell £55, or exchange for Douglas 2¾h.p.; offers.—W. Jarvis, Watermoor, Cirencester. [X8437

ROVER 3½h.p. 3-speed, countershaft, kick starter, new, unridden, perfect; list £150; no reasonable offer refused.—Box 356, c/o *The Motor Cycle*, Leicestershire. [X8043

ROVER, late 1913, C.B. sidecar, storm cape, 3-speed hub, Binks carburetter, battery lighting, speedometer, tools, spares; £65.—Hodgson, 71, Leighton Rd., West Ealing. [1597

ROVER, 1919, 3½h.p., 3-speed, accessories; any trial; £105. Rover, 1914, 3½h.p., 3-speed, perfect order; £70.—1, Norwood Rd., Herne Hill. Phone: Brixton 1964. [1623

ROVER 3½h.p., 1919, T.T., now fitted N.S.U. gear, clutch, Flying Middleton sidecar, usual accessories; trial welcomed; 90 gns.—44, Finchley Rd., Westcliff-on-Sea. [1527

ROVER 3½h.p. 3-speed Hub Combination, coach, new tyres and belt, excellent condition; ride away, any distance; £80.—Norbury, Nurseryman, Market Harborough. [1782

ROVER 1920 5-6h.p. Twin Combination, latest model; delivery from stock at list price, £235; extended terms.—Elce and Co., 15-16, Bishopsgate Av., Camomile St., E.C.3. [0071

NEW 3½h.p. Rover Motor Cycle, fitted with 3-speed clutch and kick starter and with smart coachbuilt sidecar; £180, or on easy payments 5% extra.—Harrods, 118, Brompton Rd., London. [1364

MAUDES'.—Rover 1918 6h.p. W.D. combination, all-chain, 3-speed, kick starter, Dunlop tyres, 3 lamps and horn, very little used £130.—Maudes', 100, Gt. Portland St., W.1. [2067

ROVER 1920 4h.p., 3-speed and countershaft model, complete with Mills-Fulford Corvette sidecar, done very small mileage, indistinguishable from new.—Parker's, Bradshawgate, Bolton. [X8204

ROVER 1914-15 Combination, 3 speeds, lamps, horn, speedometer, wind screen, hood, enamelling, plating, tyres in good condition; stored 3 years; would separate; £90.—202, Trinity Rd., S.W.17. [9543

1920 5-6h.p. Rover Twin Combination, Milliford Empress sidecar, Cowey horn, P. and H. lamps, only delivered 7 weeks, as new; £206; owner purchasing car.—L. Harriss, 332, Hellingboro' Rd., Northampton. [9421

F.O.C.H. have a 5-6h.p. Rover Combination, small mileage.—Fair Offer Car House, 5, Heath St., Hampstead (near Hampstead Tube Station). Phone: Hampstead 3752. Hours 9-7, including Saturdays. [1082

ROVER Combination, 5-6h.p., 1920, not done 100 miles, perfect, disc wheels, lamps, wind screen, leg shields, speedometer, hood to sidecar; best offer over £200.—Hewin's Garages, Ltd., the Real Service Firm, Totnes. [1053

ROVER 3½h.p., 3 speeds, all lamps, horn, tools, 3in. Dunlops, new Brooks saddle and belt, dropped frame, 1920 Amac, 100 miles to gallon, guaranteed absolutely faultless; £65, a snip.—2, Nightingale Rd., Lower Clapton, N.E. [1976

ROVER Combination, very late 1918, 6h.p. J.A.P., 3-speed, countershaft, kick start, hand and foot clutch, enclosed chain drive, Easting screen, all lamps, 1 horn, tools, perfect condition; bargain, £150.—Manor Garage, Manor Place, Walworth, S.E. [9763

1919 Rover 5-6h.p., French grey lounge sidecar, all lamps, Cowey, Klaxon, and Cameo wind screen, new last March, mileage under 1,000, enamel and plating like a show model, only wants seeing; offers. C. Boswell, Esq., Iver House, Abbotts Rd., New Barnet, Herts. [2000

ROVER 1914 3½h.p., underslung sidecar, excellent appearance and condition, engine and gears recently overhauled at considerable expense, fast machine, hood, screen, lighting set, new extra heavy Dunlop; £60.—Seen and tried at Clarke's Garage, South St., Romford. [1801

The Six Days Trials.

ON Monday next the most important reliability trial of the year commences at Darlington, and there is every evidence to show that the Auto Cycle Union has spared no pains to make it a series of tests in every way worthy of the support which has been given to it by the British motor cycle industry.

So far as can be judged from the rules and regulations the innovations introduced this year are steps in the right direction. In the first place the limiting of the entry—although this limit has not been reached—is a very wise move on the part of the governing body. As we suggested after the last London-Edinburgh run, there is a danger of very large numbers of competitors ultimately bringing about legislation which might prohibit the holding of trials on the public roads. In addition, 150 competitors—the A.C.U. limit—form an entry quite large enough to require careful handling even by the host of officials at the disposal of the organisers.

The finish of the trial at Brooklands is another suggestion of *The Motor Cycle*, and is one which will be appreciated by the motor cycling public, while Friday's and Saturday's routes, right down the centre of England, provide a very large number of riders with a chance to see the competitors.

Probably the tests at Brooklands will be the most interesting of the series. The performances of the various types and makes of machines in half an hour's high speed run after a week's gruelling work under touring conditions should provide the public and the makers with much useful data.

This year there are several new types of machines in the trial, in addition to new makes of motor cycles on conventional lines. We refer to the 500 c.c. two-strokes in both solo and sidecar classes, and the miniature three-cylinder radial engines, a type which is quite unknown to the majority of motor cyclists.

The courses are certainly severe—more difficult, perhaps, than any preceding Six Days Trials—but increased severity is necessary if the overall efficiency of motor cycles is to be developed. Each year sees greater difficulty in finding a route which will give a machine, in six days, work approximating to that of twelve months' use in the hands of the average owner.

Standardisation of Controls.

EFFORTS have been made at various times to bring about standardisation of motor cycle controls. So far, however, nothing has accrued to the advantage of the user. Probably this may be due to the very comprehensive aims of the engineering standards committees who have studied this and kindred subjects. Recent fatal accidents due to unfamiliarity of the carburetter controls on new or borrowed machines reveal the urgent necessity for carburetter manufacturers, at least, to come to some agreement as to which way the levers shall open.

There is a diversity of opinion as to which is the better way, to open in an outward direction or to operate the opposite way, and supporters of both systems have good arguments in favour of their choice. Which of the two is the better may be open to argument, but it is not such an important point as the desirability for all carburetter levers to operate alike, and as carburetter manufacturers are comparatively small in number, there should be no real difficulty in the trade deciding for one or the other. Which ever way is considered the better by the majority should be adopted by all, and the personal opinions of the minority should be sunk. We invite carburetter manufacturers to state their opinion as to which is the better method. Some time ago the Manufacturers' Union interested itself in the question, and we should like to see the subject revived and a final settlement arrived at in the interests of the motor cycling community.

An index to the advertisements in this issue will be found on the page facing the back cover.

OCCASIONAL COMMENTS

By "IXION"

Some Facts about Weight.

THE present weights of motor cycles have no justfication about them. Like Topsy, they just "growed." The original Morgan Runabout chassis—an 8 h.p. two-seated three-wheeler—scaled no more than 2¼ cwt. The new Grahame-White buckboard—a four-wheeled 4 h.p. two-seater—does not vastly exceed 3 cwt. Both figures are commonly exceeded by current types of two-wheeler. To take an alternative contrast, the single-geared belt-driven T.T. motor bicycle of to-day is not appreciably faster on the level or uphill than the outwardly similar machines manufactured at the time when Jack Marshall last rode in the T.T. The engines of such 1920 models are bigger and of better design than those predecessors to which I refer; and their failure to give a vastly better road performance is chiefly due to the quite unnecessary increase in weight—sometimes amounting to 100 lb. I sometimes fancy it is a great pity that a maximum weight limit is no longer specified in the T.T.

A Peculiar Trouble Explained.

LAST week I described how a machine which appeared to be in perfect order puzzled its owner by a long fit of erratic behaviour. The symptoms (see page 180, in our issue for August 12th) were due to the carburetter. This was of the type in which the sliding control pistons are located in regard to the air and gas passages by a small dowel or lug on the outer piston, fitting in a vertical groove machined in the piston housing. This lug or dowel had sheared, so that the pistons became free to rotate in the carburetter body, and were no longer in register with the air intake and inlet pipe respectively. As a consequence they twisted about in response to any twist on the control wires; the throttle sometimes assumed control of the extra air, sometimes attended to its own duties, and occasionally divided responsibility for both functions with the air piston. The rider should certainly have spotted the mishap fairly quickly, but it is well calculated to perplex a rider for a few minutes. I commend the notion to organisers of breakdown competitions.

The Chain on Tour.

I AM just preparing for a journey of something like 2,000 miles, which will occupy about a fortnight, during which time I shall seldom sleep twice in the same bed. My thinking-cap is pressed hard down on my temples, because I am perforce riding a machine with a naked chain. I know quite well what I ought to do. I should carry a spare chain, swop the two over nightly, rinse the dirty chain in paraffin, lubricate it, and wrap it in a greaseproof paper during its idle day on the carrier. But as I am a lazy man, and my luggage space is too scant to accommodate a spare suit of clothes (or a boiler suit), a pint of liquid soap, and a manicure outfit, I know what I am going to do. I shall take but one chain, plus a few spare links. Each night—when I do not forget—I shall dope the chain with engine oil, without removing it from the sprockets, and—probably—without brushing the dirt off it. Next morning much of the oil will be sprayed over the rear half of the machine during its first 400 yards on the road. What oil remains will play the part of a flypaper towards whatever dust a British summer may permit to rise. When I return home, my chain will be worn out and both my sprockets will be hook-toothed; all of which is an eloquent argument in favour of chain cases, *n'est ce pas?* Yes, I have had some, thank you. But I keep on hoping all the same.

Disconnect the Transmissions.

I HAVE never ridden down the test hill at Brooklands on a brakeless machine. But I rather fancy that Secretary Loughborough is within smelling distance of the first real brake test to which motor cycles have ever been subjected *en masse*. He proposes that the machines shall descend the test hill without stopping, and inside 10 m.p.h. If an experiment shows that a brakeless machine can safely tackle the sudden change from 1 in 8 to dead level at the foot of the hill, it is only necessary to remove all the rear chains and belts to secure a really valid test of the brakes, and a test which would have penalised quite a number of the finishers in the Scottish Trials. Since many front brakes are pure camouflage, and since a week's rough-riding plus a few tumbles often makes a foot brake rather dicky, many of us resort to engine compression and low gears towards the end of a Six Days. The test which I have indicated would prove how the brakes stand the racket, and would certainly impose a few penalties.

Makers, Look to Your Agencies.

THE other week our editorial drew the attention to the need for increased exports if prices at home are ever to fall. About the same time, one or two overseas friends called on me and gave me some appalling details of some of our motor cycle agencies. In some cases they are in the hands of clerks, grocers, native chauffeurs, etc., and that in quite considerable towns. Where such evil exists, the sequence of events appears to have been as follows. The principal garages in a town take up agencies for the British bicycles which they consider to be the best sellers. Other British makers, being unable to secure first-class agents, allot their supplies to almost anybody who asks for them. Thus, only one or two British machines are properly handled or supplied with any "service"; just at present the garages which could

Occasional Comments.—

handle agencies well are often pushing American machines for preference, because they had continuous stocks during the war. No wonder our 'buses are in bad odour in some places, when the sole agent is a clerk without capital, who is earning his living in an office five and a half days per week, ignorant how to tune the machine, possesses neither workshop nor spares, and probably takes little further interest in the deal when he has once pocketed his commission. It would be better not to export isolated machines in this fashion; a good agent and good service are essential to sound dealings in complicated mechanical goods.

Our Roads—and Taxes.

SAID a cute rider to me this week: "I shouldn't really mind paying the new taxes if I were sure they wouldn't waste the cash." When asked to explain, he produced five samples of modern Government methods. The first was a number of tar barrels wasting their sweetness on the heather, because they had been plunked overboard from a high lorry, and were all gaping at the seams. The second was a deep mud-hole bang in the centre of a patch of road which the gang had left as "repaired" on the previous day. The third was a patch of loose stone on a steep hill, which had been ripped open by wheel-pans within forty-eight hours of the departure of the steam-roller. The fourth was a choice mile of pot-holes on a main road which had been reconstructed within the past eight weeks. The fifth was a huge road gang abiding in their tents like Israel, because a sunny day had capriciously turned to rain. In all fairness to the "Government" it should be said that road work at present is in the hands of local councils to whom these examples should be ascribed. Instances one to four obviously supported an indictment of stupidity and waste; but I have nothing to say against roadmen drawing their pay when the weather breaks. Presumably they have wives and children to support, like other people, and rain is what the lawyers call "an act of God." Personally I would as soon have stopped the pay of our artillery during the shell shortage.

BRITISH INTERNATIONAL CYCLISTS AND MOTOR CYCLISTS ABOARD THE S.S. "ANTWERP."

By a curious coincidence the British cyclists selected to represent this country in the Olympic games journeyed to Antwerp by the same boat as the British motor cyclists in the Anglo-Dutch Trial. Here they are grouped together. The cyclists included W. T. Hall, Leon Meredith, C. A. Davey, B. Bragg, W. H. Genders, E. Newell, D. Marsh, H. T. Johnson, W. A. Ormston, J. F. Ditchman, H. H. Lee, Ben Jones, H. N. Crowe, S. Ayres, H. W. Bartleet, A. T. Ryam, A. White, W. G. Stewart, T. G. Lance, T. Harvey, and C. A. Alden.

Impressions of the Dutch Trial.

How Holland won the Third International Trial. A Memorable Week in the Netherlands.

HISTORY repeated itself in the third of the series of International Trials England *v.* Holland. Our first illustrated description of the event in the last issue showed that, whereas England was credited with seventeen out of eighteen non-stop runs, and Holland fourteen out of eighteen possibles, one member of the British team unluckily lost such a big total of marks that Holland scored a second notable success, and thus won outright the "N.M.V. Beker." It has already been observed that the Dutch riders handled their machines with consummate skill, and entered keenly into the contest. Their victory was well deserved, and the British contestants were themselves the first to give three stentorian cheers for the sporting Dutchmen when the result was announced at the memorable dinner on the 8th inst. at the Trianon Restaurant in Amsterdam. With seven secret checks and three open timed controls, there was plenty to keep the competitors busy on a strange course measuring nearly 200 miles. Dutch roads are, unfortunately, not such that one may concentrate on the watch and route card. One has to keep a watchful eye on the road ahead, though for this year's event the road surfaces were for the most part wonderfully good for Holland. But machines were proved to be more reliable than watches this year, for two watches stopped, to the great consternation of those who suffered this remarkable experience. Colver's trouble was a lost washer on his silent chain. He fitted another of brass, but that gave out also, and he had to repeat the repair with one made of steel, but he lost many marks during the process. Ellis went off the route near the German frontier, and was only aware of the fact when advised that he should be getting his "papers" ready. Papers were quite a joke during the trial. Each man carried a perfect sheaf, including passport, international travelling pass, identification cards for Belgium and Holland, hotel lunch and dinner tickets, and a constant password was the query "Have you got your papers?"

Bad luck also befell the Dutch team, for one man, Rijkse, lost 118 marks on account of tyre trouble, the new cover being so stiff that the rider found it almost impossible to replace on the rim after the puncture which stopped him. Why more difficult hills were not included in the Limburg district one cannot say, for the general im-

SCENES IN BELGIUM.

The British riders crossed from Harwich to Antwerp, and passed through the Belgian war zone on their way to Holland.

(1) A group of riders in Louvain; part of the Cathedral in the background.

(2) A scene in Malines, *en route* to Maastricht.

(3) Contrast in modes of transport near the Belgian-Dutch frontier.

pression of the British riders was that the object of starting the trial from Maastricht was to embrace some of the short steep ascents in this picturesque Province of Limburg.

Excellent Organisation.

Of the organisation, congratulations must be extended to our Dutch friends. Everything was splendidly arranged, reflecting great credit upon Mynheer L. G. Zegers Veeckens, the trials secretary, and his fellow committeemen. When the Dutch team visits England next year (a new trophy has already been offered by Mr. A. Citroën), the A.C.U. can at least take some points from the Dutchmen's methods.

The Dutch amateur captain, H. Fels, of The Hague, who rode a Harley-Davidson sidecar, told us he will compete in the Scottish Trials next year, as well as in the Dutch Trial in England. Of course, in Holland, the rule of the road being opposite to our own, "zijspans" (which, being interpreted, means side-

cars) are applied to the right side of the machine. The chassis of the Dutch machines looked frail, yet seemed to stand up all right, though one trials machine had a tube break. Throughout the event, however, reliability of running was the outstanding factor. As we have already intimated, full appreciation of the scenery was not possible, yet Holland provides a delightful touring ground for one acquainted with the roads. The beauty of the low lands, the succession of canals, sometimes really beautiful with yachts in full sail dotted here and

Impressions of the Dutch Trial.—there, the curious swing bridges by which traffic crosses and re-crosses these canals, the quaint costumes and customs of the people, all form a delightful change for the long-distance tourist. From Utrecht to the outskirts of Amsterdam *via* Nieuwersluis, Brambrugge, and Lake Abcoude, first through avenues of trees, now along river banks with charming residences of original design studded about, was quite the prettiest section of the whole route.

Dutch Ferries and Bridges.

The ferry over the river Waal to Lent was a new experience for the Britishers, but there was ample accommodation for quite half the competitors. The pontoon bridge over the Rhine before Arnhem was "broken" to permit the passage of several steamers. Some rather welcomed this unexpected delay in order to enjoy the scene to the full. Others who had breakfasted at 5 a.m. were pining for their two o'clock lunch, in view of the rapid recommencement.

Traffic on the road in Holland observes no rule of road. Ahead you observe a group of cyclists. They hear you, but never move. You repeat the blast on the horn, and they at once spread out on both sides and expect you to pick your way through the centre. Again, a horse and cart is approaching. A motor cycle passes, and the driver of the cart turns with his eyes fixed to the rider, never supposing for an instant that there might be another motor cyclist on earth. Again, you overtake a cart on the wrong side of the road. When within earshot you hoot. Will the driver pull aside? Not a bit of it. He first turns round slowly, just to confirm that the horn definitely has a motor attached to it, and having confirmed his impression, draws slowly, painfully slowly, aside. The kiddies in the streets are not so perky as our own youthful element. They usually wear glum faces, and stare in blank astonishment at the passage of a motor cycle. Railway crossings are very trying. They abound everywhere, and the gates rise vertically. To see one descending just as one is about to cross the railway lines is enough to send a cold shiver down one's back. It is reminiscent of a descending sword. But these are experiences enjoyable and amusing to the observant motor cyclist in the happy frame of mind engendered by the welcome accorded and continuous attention paid by the Dutch club officials. It was their object to give the Britishers a good time, and they succeeded to the limit. Not a man of the English team returned without the greatest respect and appreciation of the sporting Dutchmen. The Amsterdam Stadium was the finishing point, and here competitors' machines were garaged and dinner provided. Meanwhile the Britishers' baggage, conveyed by the Dutch club from Maastricht, was being delivered to the different hotels; this thoughtful service proving a very great convenience to all.

A Full Programme of Social Events.

Sunday saw a recommencement of the social events. In the morning there was a run to Hilversum for lunch by a charming roundabout route. Returning to the Stadium in the afternoon, motor-paced cycle and motor cycles were witnessed on the saucer track. Very exciting they proved, to those who had only read and never actually witnessed racing on these steeply banked tracks.

In the first control near Epen. C. Witteveen, jun. (on a 5-6 h.p. James sidecar) and W. Pratt (8 h.p. Matchless sidecar).

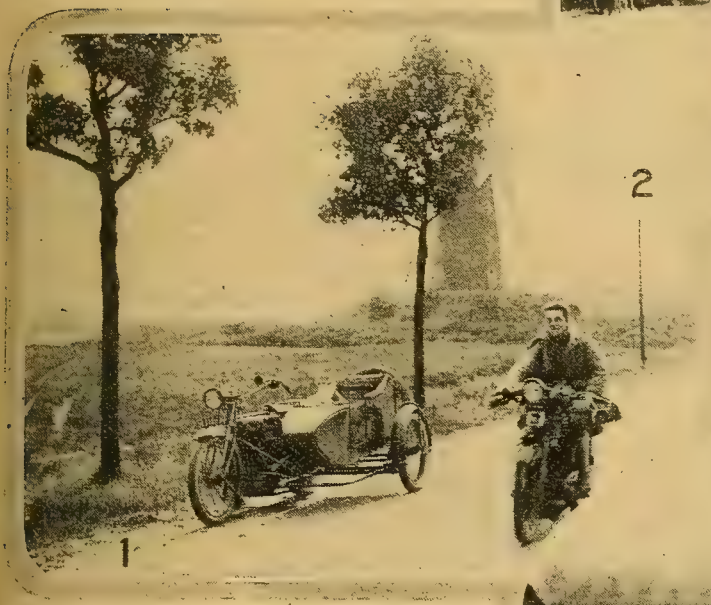
F. J. Ellis and E. B. Ware (8 h.p. Matchless sidecars) passing coal mines near Heerlen. Mr. T. W. Loughborough, secretary of the A.C.U., occupies the second sidecar.

Many daring British riders admitted thorough "wind up" to see the two Dutch riders astride stripped twin American Excelsior mounts flash round and round at over a mile a minute, whilst to see them pass one another on the steep banking was thrilling in the extreme. A motor-paced cycle race of fifty-six laps was another event with a petrol flavour. A huge V twin Laurin and Klement of about 20 h.p. proved naturally more fleet than an Anzani V twin of about 10-12 h.p., and the former pacer succeeded in piloting his man home first in wonderful time.

Floral Tributes.

That evening the official dinner, a really brilliant function, was held at the Trianon Restaurant, presided over by Mr. Nic Jannink. Ever ready to do honour to their British guests, the tables were decorated with the national flags, whilst on the head table was a splendid representation of the Union Jack in beautiful flowers. Welcome assurances of a continuance of the event, a readily accepted invitation to visit England next year, congratulations to the winning team, a new international trophy and

PICTORIAL IMPRESSIONS OF THE ANGLO-DUTCH TRIAL.



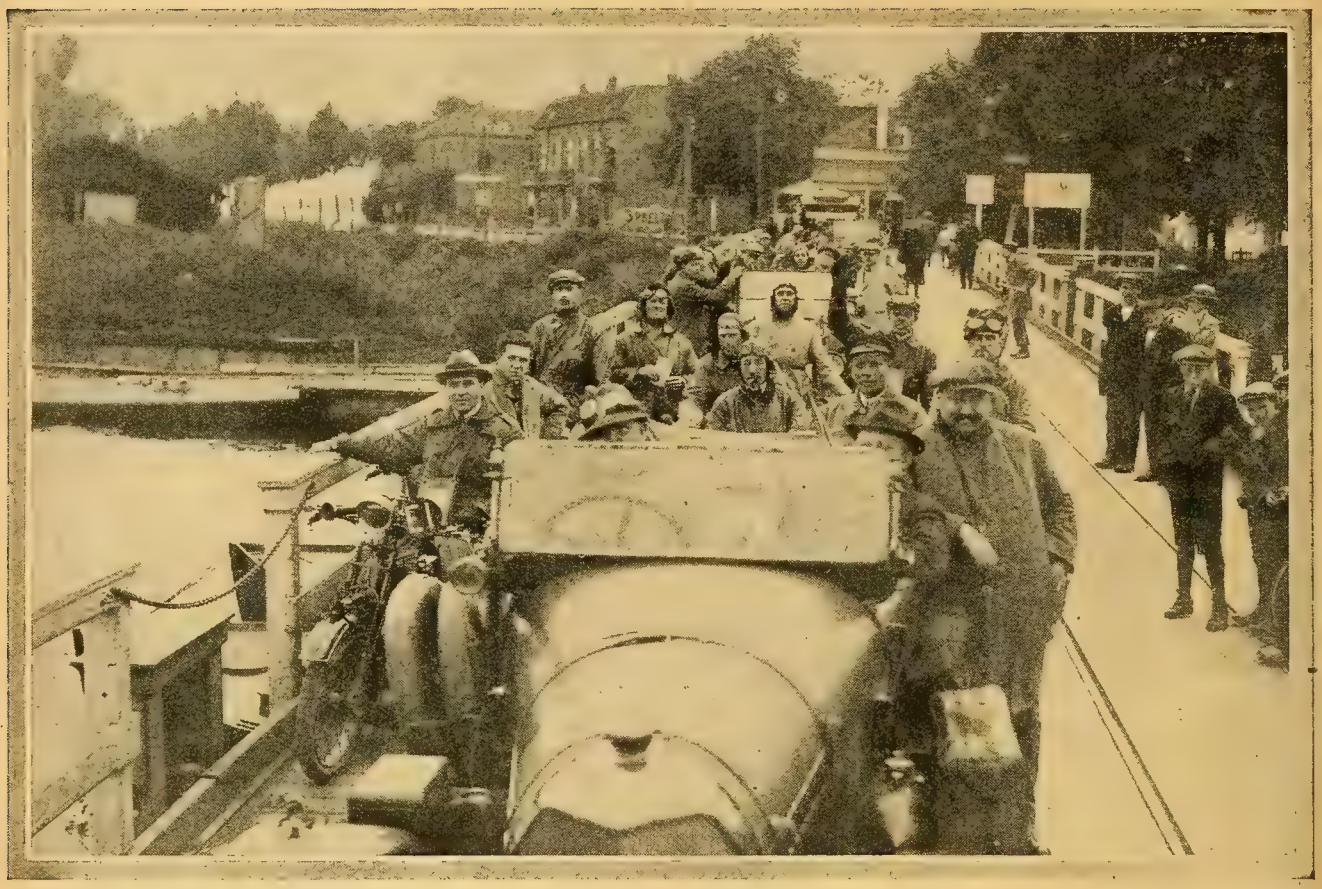
(1) Lt. Glen-Kidstone (Sunbeam) near St. Anna.

(2) W. B. Gibb (Douglas), who lost but one mark, and G. Hoogevean (5 h.p. Indian), near Plasmolen.

(3) A feature of Continental touring is the numerous railway crossings encountered. Here competitors are seen held up at one of these level crossings.

(4) J. A. Newman (Sunbeam) in Ede. To this rider belongs the credit of completing the long course without the loss of a single point.

(5) The course passed through very attractive Dutch scenery, particularly around Utrecht. Observe the paved roads, which were the usual order.



On the pontoon bridge which spans the Rhine near Arnhem. In the foregrouud may be seen Mr. Nic Jannink, president of the Royal Dutch Motor Cycle Union, driving the official car; beside him, Mr. E. J. Maas, secretary; and, standing by the car, Mr. L. J. Zegers Veeckens, secretary of the trial. Competitors are held up behind the official car while the bridge is opened.

further offers of cups for 1920, represented the tenor of the speeches. The speakers included Mr. Jannink, Mr. Zegers Veeckens, Mr. T. W. Loughborough (secretary A.C.U.), Mr. Geoffrey Smith (Editor of *The Motor Cycle*), Mr. Boom (Editor of *Der Auto*), Mr. Maas (secretary Royal Dutch M.C.U.), Messrs. Pratt, Fels, Hardy, Newman, and Boer. The two lady passengers of the British team, Mrs. Boynton and Mrs. Crossthwaite, received handsome bouquets of flowers as well as a souvenir of their visit.

Dykes and Windmills.

Monday witnessed the departure of the British party from Amsterdam. First they were taken through delightful lanes in the Blomendal neighbourhood, and thence to the coast at Zandvoort for lunch. Each party was piloted by Dutch riders acquainted with the roads. At the seaside, lunch was taken at the Kursaal, and many would have preferred to have tarried awhile, but it was not to be, for, keen that the British party should see the dykes and windmills, the procession of a hundred odd riders, headed by Mr. Zegers Veeckens on his 1920 model A.J.S. and sidecar, proceeded to The Hague *via* Noordwijkerhout and Haagsche Schouw (pardon!) The dust cloud raised was almost impenetrable, but it was no use losing the party, for, with names like the two mentioned to enquire for, a solitary Englishman would experience an anxious time! Among the party were a number of Dutch solo riders with ladies on pillion seats. Pillion riding, despite the rough road surfaces, is very popular in Holland, but it is done properly. The seats are sprung, of course, and the lady sits astride with rests for her dainty feet on each side. Immediately in front of the seat is a stout plated rail, by which she may mount gracefully. To see a young couple wearing skull caps aboard a sporting twin bellowing through its stovepipe apology for a silencer, the riders rising and falling in unison by the action of the springs, is a most animating spectacle. A "Tally Ho!" bugle would add quite the final touch to a sporting turnout.

Au Revoir!

A cup of tea near The Hague, provided by the Editors of *Der Auto* and *Auto Leven*, the party continued to the Hook of Holland, where adieu was paid to the hospitable Dutchmen till another year. Aboard the s.s. *St. George* that night a telegram reached the captain of the British team from Mr. Jannink, conveying good wishes to the departing visitors. Thus ended the third and most memorable Anglo-Dutch Trial.

G.S.

OBSERVATIONS IN HOLLAND.

Ask W. B. Gibb if he has yet solved the mystery as to how he lost that solitary mark in the Netherlands!

The four British riders who have competed in all three Dutch trials, viz., F. Dover, W. Pratt, F. A. Hardy, and G. Smith, again succeeded in accomplishing non-stop runs.

The Worcester and Surbiton clubs have already offered cups for next year's event, as well as *The Motor Cycle*.

On one occasion Kaye Don gave a waiter a number of Dutch coins as a tip, thinking he had done him proudly. His amusement was complete on discovering that the value of the tip was about 1½d. They have coins of one-tenth of a penny in Holland.

Travelling passes and passports seem to be becoming a farce. Abroad no notice was taken of half the papers the British riders carried.

Another time the A.C.U. would be well advised to look after a British party of motor cyclists properly at the ports. The sequel to the much-vaunted claim of special touring facilities abroad was not appreciated by the party.

Impressions of the Dutch Trial.—

What is happening to Britain in the world of sport? The yacht race lost, the motor boat race lost, the tennis championships wrested from us, and now an all-British team of motor cyclists beaten. 1921 must see a change!

There were six British-made motor cycles in the Dutch team—a smaller proportion than usual.

Motor cycles are in demand in Holland. 1921 should see a considerable expansion of the motor cycling movement.

To enable the exclusive illustrated report of the Anglo-Dutch Trial to appear in last week's issue, *The Motor Cycle* photographer journeyed with the competitors throughout the trial on his Matchless sidecar, and then continued from Amsterdam to the Hook in order to catch the boat to Harwich that evening. Lt. Kidstone, R.N. (3½ Sunbeam), who was under orders to join his ship, accompanied him.

When Secretary Loughborough arrived at Maastricht from Paris he was full of the International Six Days Trial to be held in Switzerland next summer. Switzerland won the Grenoble Trial this month, so that the succeeding event automatically takes place over Swiss mountain roads

---

"Ixion" recently asked how to carry a spare chain. Fred Dover has solved the difficulty on his Triumph by lashing with insulation tape a spare chain to each of the legs of the stand.

The Dutch motor cyclists were very interested in the Easting windscreen on H. Boynton's James sidecar. Hitherto, most of the sidecars imported into Holland have been of the American variety—small in dimensions and bare of such refinements as hood and screen.

SPECIAL AWARDS.

Each rider completing the trip without the loss of marks will be awarded a gold medal.

Each rider completing the trip with a loss of one to ten points receives a large gold-plated medal, eleven to twenty points a large silver medal, and with twenty-one to thirty points lost a bronze medal.

J. Newman (Sunbeam) gained the silver cup presented by Nic Jannink, also the B.S.A. gold medal.

A special prize presented by "Cedos House" for the best performance on a two-stroke was won by Hugh Gibson (2½ Clyno).

L. Newey (Ariel) and W. B. Gibb (Douglas) tied for the gold-plated silver medal presented by Herman Smit.

H. Fels (Harley-Davidson sc.) won the gold-plated silver medal presented by E. J. E. Maas.

The silver cup presented by J. A. Boom was won by F. Janssen (7-9 h.p. Harley-Davidson).

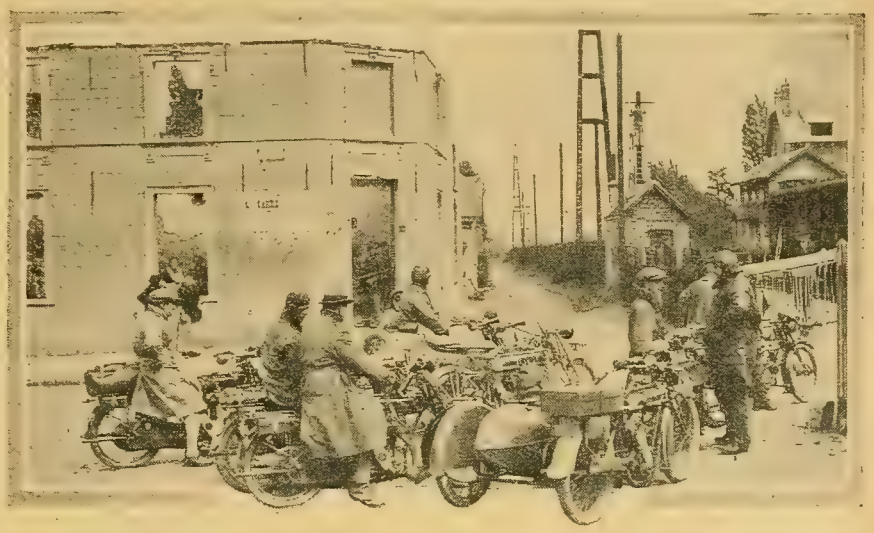
Reserve Riders in the Trial.

In conjunction with the Anglo-Dutch trial, a class was set aside for reserve riders, and run on precisely the same conditions as the International event.

The score of the reserve riders was as follows:

	Points lost.
J. W. G. Todd (Reading-Standard) ...	552
L. J. van Haren (2¾ h.p. Douglas) ...	8
E. Ekker, Jr. (4 h.p. Bianchi) ...	31
N. Rouwens, Jr. (6 h.p. Simplex) ...	18
J. M. Boom (7-9 h.p. Indian)	3
D. S. Kluit (7-9 h.p. Harley-Davidson)	3
J. A. Hanse (6 h.p. Royal Enfield) ...	3
A. Steensma (4 h.p. Blackburne) ...	5
V. Ponck, Jr. (2½ h.p. Cedos)	571
H. van der Wal (8 h.p. American X)	12
J. H. P. Jansen (7-9 h.p. Harley-Davidson)	28
H. C. Dolk (6 h.p. Martinsyde) ...	11
V. van Zijll (7-9 h.p. Harley-Davidson)	3

The best performances among the reserve riders were, as will be noted, accomplished by Messrs. Boom, Kluit, Hanse, and van Zijll, whom it was decided should draw lots for the silver cup presented by Mr. L. J. Zegers Veeckens.



Constant traces of war were evident during the trip across Belgium to Holland. A railway crossing near Louvain

The Longest Hill-climb in Europe.

THE longest hill-climb in Europe, if not in the world, is the annual sporting event up the Italian side of the Alps, from Suza to near the top of Mont Cenis Pass. This event, which is open to both motor cycles and cars, is the most important of its kind in Italy, and although it has never attracted many foreign competitors there is never any lack of Italian riders, not all of whom mount machines of home production.

As the event starts at six o'clock in the morning it is necessary to set out at daybreak to reach a point of vantage on the top of the mountain, nearly 6,000 feet above sea level. The start is in the village of Suza, and by Government Order the road is closed to all other traffic. At the outset a steep gradient has to be tackled, and of the 13¾ miles constituting the climb, about half a mile is almost level and the rest varies from easy gradients with gentle curves to successions of zigzags and hairpins which tax the skill of the riders.

The most difficult portion comes near the end, when after covering a half-mile straightaway with a very slight gradient, the "Staircase" has to be tackled. This is very appropriately named, for the road doubles back on itself in such a series of ledges that viewed from a distance it looks like a giant's staircase. From the top "landing" there is a most wonderful view, not only right down the "Staircase," but towards the valley miles below. The whole scenery, with its contrasts of blue sky, snow-capped peaks and abrupt precipices, is beyond description.

It was possible to appreciate the difficulties of the route when going up the mountain in the early morning to witness the race. Whilst most of the solo machines made the climb without difficulty, not a few of the sidecars had to shed their passengers, and getting away again on the steep gradients was not always an easy matter. Among those going up were the competitors in the Rome-Antwerp reliability run, many of whom found it possible to wait an hour and watch the hill-climb.

This year the best performance was made by the Italian Della Ferrera on a 500 c.c. machine of his own construction. His time was 21m. 45s., which was 26s. slower than the record set up in 1914 by Bordino on a 500 c.c. Motosacoche.

The results were as follow:

350 c.c. CLASS.

		Time. m.	s.
1.	Foglia (Douglas)	33	52⅗
2.	Fiandesio (Imperial)	34	41⅘

500 c.c. CLASS.

1.	Della Ferrera (Della Ferrera)	21	45
2.	Gnesa (Motosacoche)	22	32⅗
3.	Gianoli (Motosacoche)	25	55⅖

1,000 c.c. CLASS.

1.	Bordino (Harley-Davidson)	21	47
2.	Malvisi (Harley-Davidson)	22	1⅘
3.	Contarini (Harley-Davidson)	22	46⅘

SIDECARS, 1,000 c.c.

1.	Borgarello (Harley-Davidson)	20	10⅗
2.	Zanchi (Clyno)	32	42

A LIGHTWEIGHT TENT FOR MOTOR CYCLISTS.

Dunhill's light tent for motor cyclists can conveniently be carried on a sidecar.

DIFFICULTY of arranging for suitable accommodation has made the camping tour exceptionally popular during the present holiday season.

Consequently, a reference to some very useful tents, which are suitable for this purpose, and can be folded in such a way as to allow their easy accommodation on the machine, cannot fail to interest many of our readers.

A lightweight tent, suitable for two motor cyclists, and known as the "Bivouac," is made by the Lightweight Tent Supply Co., High Holborn, W.C.1, is made in three sizes, the largest measuring 6ft. 6in. × 4ft. 4in., and weighs only 60 oz. This firm also manufactures ground sheets, sleeping bags, and numerous utensils and equipment which go to complete the camping kit.

Another useful tent of reasonable size for two persons is sold by Alfred Dunhill, Ltd., 359-361, Euston Road, London, N.W.1. The feature of this shelter is that it can be folded so that its measurements are reduced to 2ft. 6in. × 8in. × 5in., and therefore can easily be housed in the rear of a sidecar or strapped to the carrier of the motor cycle. A ground sheet is not required, as the two walls and the floor of the tent are made in one piece forming a triangle. Three collapsible poles support the roof, and the usual guy ropes and pegs are included. The total weight is less than 7 lb.

IN PRAISE OF LARGER TYRES.

THE modern reliability trial is apt to include a certain amount of freak surfaces, and such surfaces when they consist of rock outcrop and large stones are none too good for wheel rims. After sustaining one or two bad dents in the rim and innumerable jolts to the spinal column, the rider, who was intending to cover the route of the Scottish Six Days Trials cast around for a suitable means of saving both the rims of his motor cycle and that part of his person which in youth is reserved for castigation.

After some thought he decided to write to the Palmer Tyre Ltd. and enquire what might be the largest tyre which could be fitted to 26in. × 2¼in. rims, and in reply received a courteous answer explaining that 26in. × 2¼in. tyres were, obviously, the correct size, but that, though they were unable to guarantee results, they were aware that 28in. × 3in. tyres were sometimes fitted.

A Successful Experiment.

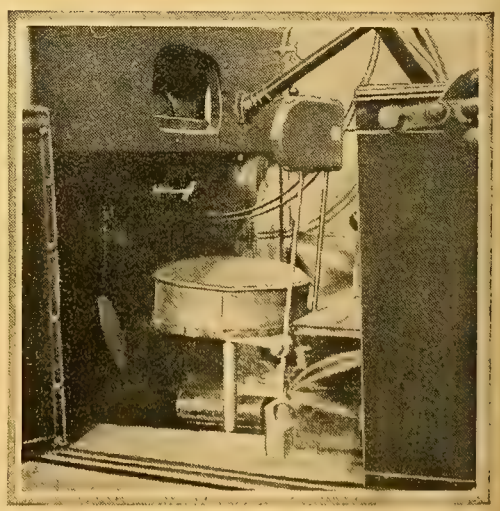
Now it is unwise to start on a Scottish Six Days with experimental fittings; but as the writer also had met with instances where 28in. × 3in. tyres had been used successfully on similar rims, and in France at that, he decided to try the experiment. A Palmer cord heavy 28in. × 3in., to fit American rims, was accordingly obtained and fitted to the rear wheel. The tyre slipped into place so easily that caution demanded security bolts. These were duly fitted, and the machine was driven hard for some two or three hundred miles over good roads. So satisfactory were the results from the point of view of comfort and reliability that the experiment was considered a success. Nevertheless, it was not without some qualms that the loose and rutty Scottish roads were tackled, for if anything will "roll off" a badly fitting tyre it is ruts or gravel. After safely negotiating the fearful roads from Lairg to Bettyhill on the second day of the trial all fears departed, and it is sufficient to state that the tyre gave no signs of trouble throughout the arduous trip. At the close of the trial the tyre was carefully examined. A nail had entered the cover and turned sideways, doing no damage whatever, and there were two slight cuts in the tread. Beyond this and a reasonable amount of wear on the three rib tread, the tyre was in faultless condition, and the only attention which it has since received has been to allow a certain amount of air to escape so as to provide easier riding over Midland roads, which between the pot-holes are tolerably smooth.

As a result, the writer has formed a resolution that nothing under 3in. tyres is good enough for him on future mounts.

H.D.T.

ACCOMMODATING A CHILD IN A MORGAN.

THE pleasure of a long ride in a sidecar, or cycle car, can be totally marred from the passenger's point of view if one is encumbered with a child on the knees. Even if the extra passenger is accommodated with an ordinary footstool, there is a likelihood of the passenger's knees and feet being cramped. The Barton auxiliary seat is designed to obviate this discomfort, the seat being supported on a single pedestal that fits into a socket containing a coil spring fixed in the floor of the sidecar. We have had this little seat in use for several months on a Morgan, and its decided advantage over an ordinary makeshift seat, with four supports, has been fully appreciated by the passengers. The circular seat is well sprung and padded, and the child's back is supported by a rest that can be adjusted to any height. The maker of the seat is Mr. S. Barton, 4, Windsor Street, Coventry.



The Barton auxiliary seat as used in a Morgan de Luxe

THE HOUR RECORD.

A Few Facts and Figures concerning the existing 500 c.c. Record.

RECENTLY, J. Emerson, on an A.B.C., beat the previous hour record for motor cycles of any size excepting 1,000 c.c., covering 67.93 miles in the 60 minutes. This is a wonderful performance for an engine of less than 400 c.c., and a few notes about what such a performance means may be of interest.

In the first place such a speed indicates that the engine must be turning over at the rate of 4,240 r.p.m., and the number of "revs" accomplished during the hour amount to upwards of 254,400, well over a quarter of a million, with a gear of 4.8 to 1. It is generally considered that high "revs" mean large horse power, and up to a certain point this is true—in fact, more than one horse power formula includes the number of revolutions among the other figures, by which it arrives at its result; for instance, the Hospitalier formula, which is well suited to motor cycle calculations, gives very reasonable results for a motor cycle in ordinary and travelling at moderate speeds. The formula usually ascribed to Dendy Marshall (but claimed by more than one) also includes "revs" in one of its forms. This formula gives results which may be reached by careful tuning.

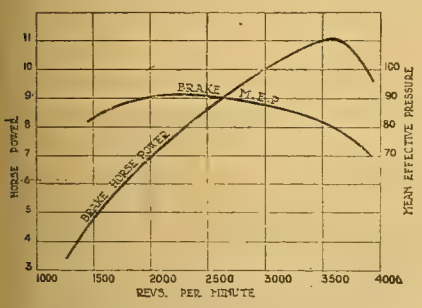


Fig. 1.—Curves showing the brake horse power and brake mean effective pressure for a single-cylinder engine, 85 × 88 mm. = 499 c.c. capacity.

Although, as I have said, the horse power increases with the "revs" up to a certain point, it does not continue to do so, up to the full speed of which the engine is capable, and it is the aim of engineering to make the power curve of an engine as straight as possible, so that it may continue to rise with the "revs" to the utmost extent. As a rule, the power will begin to drop some time before the 4,000 r.p.m. mark is reached, therefore it says much for the engine in question that the required horse power could be sustained at so high a speed for so long as an hour.

Maximum Speed.

Fig. 1 shows a typical brake horse power curve, which, it will be seen, drops quickly when the "revs" exceed 3,800 per minute, or fall below 1,500 per minute, the maximum power being given at just over 3,600 r.p.m. On the same graph I have also shown the curve representing the mean effective pressure, or ηP as it is sometimes called. These are the curves given by a well-known successful 3½ h.p. single-cylinder engine, the Rudge. It is, of course, largely the fall in the mean effective pressure, owing to the difficulty of completely filling the cylinder with gas at high speeds, that accounts for the falling off in horse power when the speed becomes very high. Obviously, for racing purposes, a motor cycle should be so geared that its maximum speed is attained at that number of r.p.m. which gives the greatest possible horse power.

Air Resistance.

At high speeds air resistance, which is a negligible quantity when moving slowly, absorbs the greatest amount of horse power. The air resistance varies approximately as the square of the speed, and as the area of the surface exposed to the air. But the shape of the surfaces also has considerable bearing upon the resistance, hence the streamlining of aeroplanes and racing motor cars. The upper curve in fig. 2 shows the resistance of a racing motor cyclist (who is supposed to present a surface of 5ft. to the air) by the Eiffel Tower formula, taking .003 as a constant; but as the surface in question is by no means flat, and the curved surfaces give a certain amount of streamlining effect, I have plotted out a second curve taking the constant as .002. If a motor cycle could be streamlined this figure might be still further reduced, but the streamlining of motor cycles (although suggested more than once in these pages) is still to become a *fait accompli*, but the rider has been streamlined to some extent. This was done in the case of Emerson himself, some years ago.

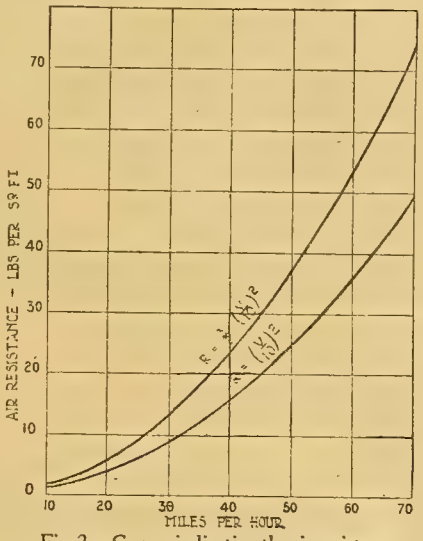

Fig. 2.—Curves indicating the air resistance to a racing motor cyclist. The top curve gives the Eiffel formula, taking the surface as five square feet. The bottom curve is a modification to allow for the shape of the surface.

Horse-power.

We have seen that the air resistance varies as the square of the speed, but the horse power required to overcome that resistance varies as the cube of the speed, for not only is the power of the resistance in-

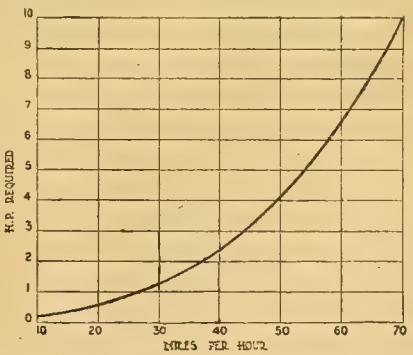

Fig. 3.—Curve showing the horse power required to propel a racing motor cycle over Brooklands track, taking the road resistance as 36 lb. per ton, and the air resistance as given by the lower curve in fig. 2.

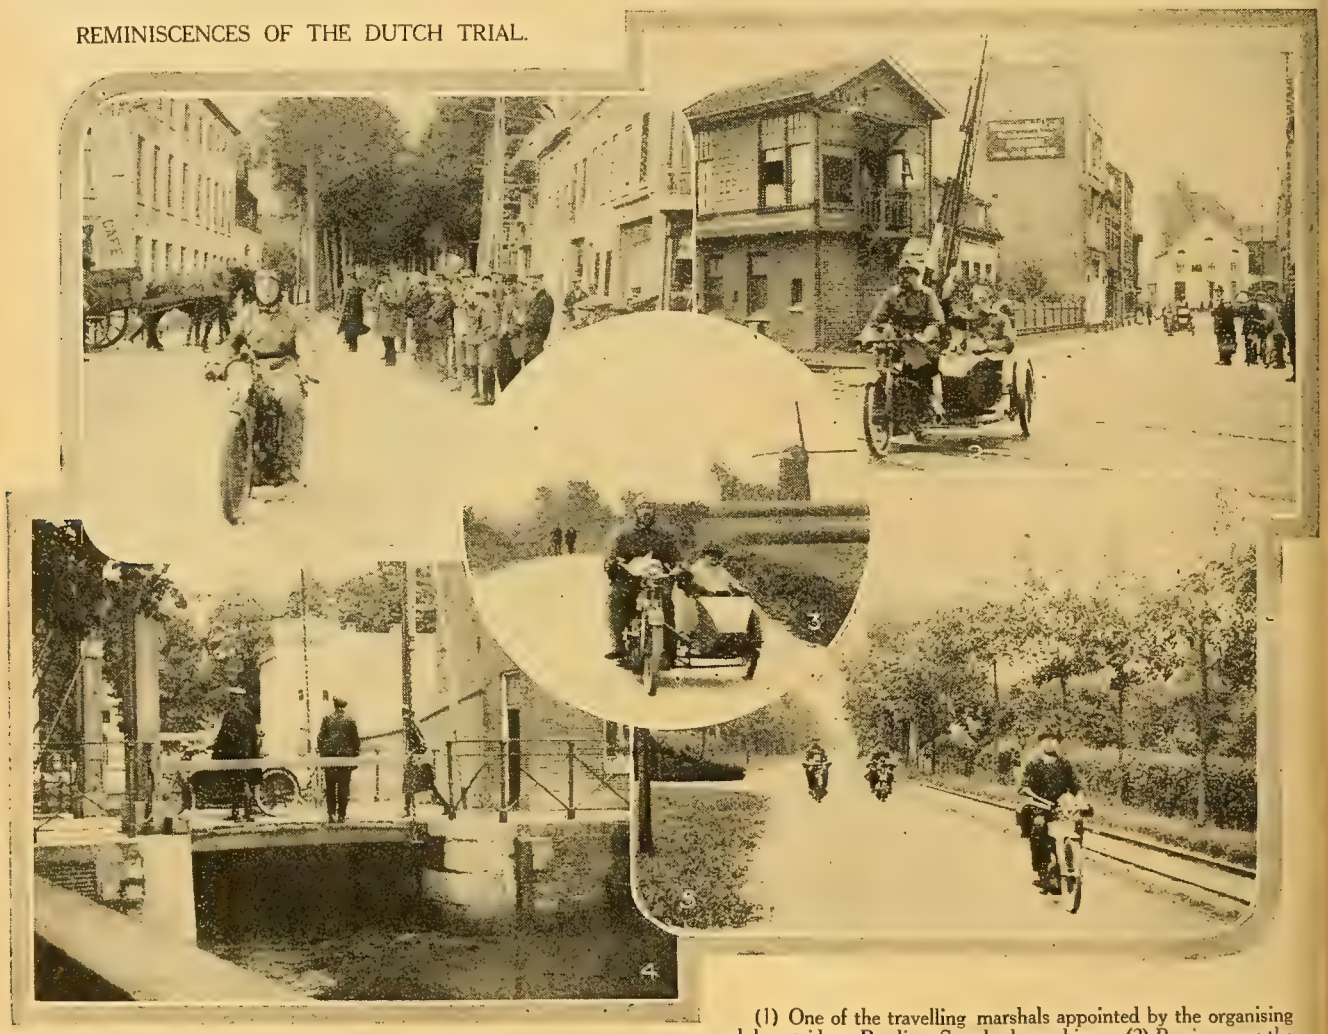
The Hour Record.—

creased by the faster passage through the air, but that resistance has also to be overcome in a shorter time, and horse power is the rate of doing work. Now, Emerson covered many laps at a speed of 70 m.p.h., and on reference to fig. 2, taking the lower curve as more likely to give a correct result, we find the air resistance at 70 m.p.h. to be 49 lb. If we take the weight of the machine and rider to be about 370 lb. (1/6 of a ton), and the tractive resistance on Brooklands track at 36 lb. per ton, we have a total resistance of 55 lb., and the required horse power to maintain this speed will be $\frac{55 \times 70 \times 22}{15 \times 550} = 10.26$ and this is, as I have already said, very creditable to so small an engine. The average piston speed was about 1,500 feet per minute, consequently the velocity of the inlet gas must have been in the neighbourhood of 17,100 feet per minute, or 285 feet per second, which exceeds 194 m.p.h. AURIGA.

REMINISCENCES OF THE DUTCH TRIAL.



(1) One of the travelling marshals appointed by the organising club astride a Reading Standard machine. (2) Passing over the railway crossing in Heerlen—C. Wittevcen, jun. (5-6 h.p. James sidecar). (3) W. van Zijll (Douglas sidecar) in a typical Dutch countryside scene. (4) H. Boynton (5-6 h.p. James sidecar) crossing the swing bridge over the canal at Nieuwersluis. (5) Three competitors on the road to Ginkel. Observe the railway lines by the roadside.

FULL TIME GARAGES.

THERE are places where garages rank themselves in the same category as hotels, churches, surgeries, and pharmacies, remaining open practically continuously for emergency purposes, and at practically all daylight hours for routine services. There are others where garages take their responsibilities very lightly indeed. It is extremely common for the entire staff of a garage, excepting only a single casual urchin, to take their lunch simultaneously. It is by no means uncommon for a garage to shut on the local early closing day. I always feel a profound sympathy for people like publicans and agriculturists, who never get a day off; and I quite admit the problems involved. If the staff is big, there should be no trouble in arranging for one responsible individual to lunch early or late, and to remain on duty throughout early closing day. Early closing day is seldom the pet holiday for employees, who prefer Saturdays for their day off. Anyhow, garage owners who wish to draw custom and make money must perceive that the place where service is *always* obtainable is the one which will ultimately make good. Last week in quite an important town I spent an hour on early closing day in obtaining a tin of petrol. IXION.

A Sporting Trial on the Welsh Border.

Worcester and District M.C.C. One Day Trial.

FINE weather, an interesting course, and excellent organisation, characterised the recent one-day trial organised by the Worcester and District M.C.C. The course, which was 116 miles in length, was very well marked with arrows and colour. The system of timing was the same that was found so successful in the Scottish Six Days Trials, *i.e.*, each check stands by itself, and once marks are lost they cannot be regained. This innovation, so far as English trials are concerned, is due to the fact that several of the most active members of the Worcester club have competed in the Scottish trials, and thus appreciated this feature.

Starting outside Worcester at 10 a.m. competitors took the main road through Bromyard, Leominster, to Aymestrey, where the course lay to the right down a rough and narrow lane. Here the first obstacle, a watersplash 25 yards long, was encountered; it caused a number of failures. A. Thomas (Diamond), E. S. Ranstedt (3½ Ariel), D. B. Flux (4 Triumph sc.), and Edkins (Edmund), failed to make a clean passage or stopped on the rise with belt slip. J. A. Chadwick (Diamond) sheered his pulley key but managed to effect a repair of sorts and continued. The main road was gained at Presteign, through Walton and Gladestry, followed by another very rough section to Clyro. A second splash was encountered but did not prove difficult. E. Ranstedt, however, took it fast and suffered with belt slip and carburetter trouble; shortly afterwards we passed D. B. Flux in the ditch minus his sidecar disc, and in trouble with tyres.

L. C. M. Davies (Velocette), who rode consistently throughout, on the narrow lane near Lingen.

T. B. G. Vale (Norton), followed by M. Hartland (N.U.T.), negotiating the watersplash
The deep ruts on both sides caused several failures

A Stiff Climb after Lunch.

Twenty-three riders checked in at the lunch stop at Glasbury, D. L. Greig (3½ Sunbeam) arriving late, having punctured. We noticed J. A. Chadwick (2½ h.p. Diamond) trying to repair his transmission, but apparently he was unsuccessful as he failed to finish. The first obstacle encountered in the afternoon was Trevadoc Pitch outside Hay—a long rough climb with countless cross gulleys terminating in an S bend with a very loose surface and a gradient of about one in six. The star performances here were made by A. F. Harris (A.J.S.), T. B. G. Vale (Norton), L. C. Davies (Velocette), B. Bladder (New Imperial), and the two Morgans. A. Thomas (2½ h.p. Diamond) broke his belt on the first turn, while E. S. Ranstedt (3½ h.p. Ariel) ran up the bank. J. W. Wills (7-9 h.p. Indian sc.), who was carrying Fell Smith in his sidecar, failed near the top through clutch slip, and later on his coat caught fire, but without any serious consequences. L. Warren (2¾ h.p. Douglas) appeared "done up," having hit a cow near Hay. He, however, pluckily carried on minus footboards and finished. H. Moule (5-6 h.p. Rover sc.) just failed to make the climb, other failures being C. F. Quant (Triumph sc.) and W. Edkins (Edmund). Onwards the course lay over by-roads to Hereford, thence by the Worcester road over Froome Hill to the starting point. This hill was not observed, the majority of the competitors making light of it, though one or two failed.

The following competitors completed the course:

A. F. Harris (6 A.J.S.)
J. Westwood Wills (7-9 Indian sc.).
T. B. G. Vale (4 Norton).
L. C. M. Davies (2¼ Velocette).
B. Bladder (8 New Imperial sc.).
N. A. Bain (3½ Sunbeam).
G. Bernard (3½ Sunbeam sc.).
W. A. Carr (10 Morgan).
A. Thomas (Diamond).
F. Drew (3½ N.U.T.).
J. A. Fellows (James).
M. Hartland (3½ N.U.T.).
O K Bevington (3½ Sunbeam sc.).
H. Moule (5-6 Rover sc.).
L. Warran (2¾ Douglas).
D. L. Greig (3½ Sunbeam).
C. F. Quant (4 Triumph sc.).
G. H. Leeke (10 Morgan).
J. M Dosher (6 Enfield sc.).
W. Edkins (Edmund-Jap).
E. S. Ranstedt (3½ Ariel).

THE GRAND PRIX.

WITH fifty-three motor cycles and cycle cars entered for the Grand Prix Race at Le Mans on August 28th, and twenty-four machines for the voiturette or light car race on the following day, this two-day meeting in the Sarthe ought to be the most interesting French event of the year. The club has selected a short circuit only two or three miles from the city, with direct tramway communication to the main grandstands. The roads, while not being really bad, are somewhat rough for a motor cycle race, and will test the solidity and stability of the machines. The firms represented in the three motor cycle classes of 250, 350, and 500 c.c. are Thomann, Moto Solo, Alcyon, Motosacoche, Verus, Rudge, Peugeot, Blériot, A.B.C., and Douglas.

There are two cycle car classes, but as there are only a couple of 750 c.c. machines all the interest centres in the 1,100 c.c. class. If exception is made of the well-known Morgan, all the cycle cars are of new designs brought out since the Armistice, and some of them are by entirely new firms. The makes are Elfe, Automobilette, Ruby, Jourdain, Douglas, Ch. Fournier, Noel, Blanc and Guillon, Soriano-Pedroso, Major, and Morgan, each firm entering from two to four vehicles.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters must be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

ONE-GALLON PETROL CANS.

Sir,—With reference to "Ixion's" remarks on the above subject in your August 5th issue, under "Occasional Comments," I have got over the difficulty by converting a gallon oil tin with a petrol filler fitting and cap, off an old motor cycle tank, soldered in place of the existing filler, which makes it petrol tight. This is easily carried in a sidecar.

W. N. SPARKES.

TYRE CREEPING.

Sir,—We notice a letter in a recent issue of your journal from Mr. Leslie Eveleigh, stating the trouble he has experienced due to his tyres creeping.

We suggest that he fit Leosco patent tube savers to his rims, when he will find that they will cure his trouble entirely, without having to worry with security bolts. In addition, as is well known, they protect the inner tube from the rim, etc.

LEO SWAIN AND CO.

CARRYING SPARE CHAINS.

Sir,—In your issue of July 29th, "Ixion" asks for suggestions for carrying spare chains. The following method may seem to him worth trying.

Procure a flat tin which will just hold the chain when rolled up. Then roll up the chain with a strip of thick brown paper between the turns. Place the chain thus rolled up in the tin and pour in melted tallow. Prices' Candle Co. would no doubt be able to supply a better lubricant to use in place of tallow. In any case the chain will not come to any harm.

H. ROTTENBURG.

Cambridge.

THE DEGORY CARBURETTER.

Sir,—I was very much interested to read that your correspondent "Not Infallible" had achieved 113 m.p.g. on a Scott, and would very much like to know whether he has tried a Binks carburetter, for, if the Degory is a 30 m.p.g. improvement on that, I shall certainly get one for my Scott.

My machine has, perhaps, hardly had time to get quite "run in" yet, but I am getting just over 40 m.p.g. with a sidecar, and I feel I ought to be able to improve on that.

I should also like to know how he explains his getting better results with the plugs in the cylinder heads.

A. K. GORDON.

Sir,—With reference to "Not Infallible's" experience with the Degory No-jet carburetter, I have been using this carburetter for some time, with most excellent results, and on my standard 2¾ h.p. Douglas I have been obtaining over 120 m.p.g. on long runs.

A. E. WILLS.

CHIVALRY.

Sir,—Returning from Horsham recently on my two-stroke, I ran short of petrol one and a half miles from East Grinstead. I had to push my machine there, as nobody offered assistance. When I stopped occasionally for a rest, men in cars and on bicycles laughed at me; one man rudely suggested that I "hit it, and perhaps it will go." Probably he thought it quite a good joke. Anyway, he rode on laughing, without offering help. Considering I am a girl, I should have thought that at least one man would have shown himself gentlemanly enough to stop, even if he could not be of any assistance.

It makes one feel disgusted with boys of eighteen and twenty, and some of the older men are not much better. It is those who would be very grateful for help that are unlucky enough not to receive any.

(MISS) H. PEALL.

FINISH.

Sir,—I note with pleasure "West Countryman's" lines on the finish of Diamond machines; mine is a similar experience to his, although hailing from the North Country, where, perhaps, there has been more severe tests due to the weather this year. Although seldom cleaned properly, my machine shows no sign of bad use. I have disc wheels attached, which save an enormous amount of cleaning. I have no connection with this firm beyond being a satisfied owner.

NORTH COUNTRYMAN.

Masham.

A SILENCING TIP.

Sir,—I ride a 2¾ h.p. Douglas, and have found an effective method of silencing the noise made by the tappets striking the valve stems. I obtained four spent .22 rifle cartridges (copper) and inside each I put a small piece of rubber about ⅛in. in depth. I fitted these to the ends of the valve stems, and adjusted the tappets so that the base of the cartridge just rested tight on the tappet head. The necessary space between the valve stem and the tappet head is taken up by the play in the rubber. This could be done on other machines by obtaining a larger size of cartridge. When the copper wears out, new cartridges can be fitted.

Maybole. HIGHWAY.

FREEMASONRY OF THE ROAD.

Sir,—Last Saturday, having mended a puncture in the Edgware Road by the flying ground, I rode away having insecurely fastened a tool bag. I was pulled up in about one hundred yards, and turned back to have my tool roll returned to me by an honest motor driver who had seen it fall. But there was still missing a roll of tools in a duster, including two Triumph special spanners and a large King Dick.

On speaking to a constable some ten minutes afterwards after a fruitless search, he said: "Oh, were they yours? I saw the chauffeur of a car with two occupants stop and pick them up. I thought it curious that such a thing should have dropped from his car and asked him if they were his. He replied that they were. And departed."

Where is the freemasonry of the road?

C. J. GORDON SEDDON.

MINIATURES.

Sir,—We have carefully noted the letter signed by Mr. J. D. Timmins, relative to motor scooters in your issue of the 5th inst.

We welcome the views expressed by this contributor respecting the question of reliability trials for these little machines. We understand that in order to prove the possibility of travelling a distance of over a hundred miles on an A.B.C. Skootamota, a client of ours last Sunday travelled to Brighton and back, and in his report to us he stated that no trouble was experienced, but he emphasised the necessity of travelling at a pace within the limits of the engine fitted to the machine. We mention these facts, as we rather fear from reports received that the general public consider the possibilities of the motor scooter unlimited, whereas it is most desirable that they should be educated up to the fact that, used with intelligence and care, these machines, although essentially designed for short journeys, can be used for long distances.

We should welcome the views of other contributors and users, and trust you will bring this letter to the notice of numerous interested readers.

GILBERT CAMPLING, LTD.

CONSIDERATE DRIVING.

Sir,—I think a general warning should be given to touring motor cyclists in general, and South Wales motor cyclists in particular, to take great care in driving through Neath, Burton Ferry, and Port Talbot. Several prosecutions for driving to the public danger are pending. As is characteristic of most centres of police activity, the condition of the general street traffic is chaotic. In Port Talbot in particular the police have no control whatever over pedestrians or vehicles. ALEX. LINDSAY.

TOOLBAG FASTENERS.

Sir,—With reference to "Ixion's" comments on toolbag fastenings, it may be comforting for him to know that the old strap and buckle fastening is not altogether dead and unused.

As toolbag manufacturers, we are constantly pointing out the obvious advantages of the old method of fastening, and many motor cycle manufacturers, whom we have the pleasure of supplying, fix to their machines bags with the strap and buckle fastening.

We venture to suggest that "Ixion's" lamentations would be permanently relieved if he strode into the premises of a modern motor cycle depôt and noted the makes which still stick to the ancient fastener, "the strap and buckle."

J. PARFIELD AND CO.

SANS MAGNETO

Sir,—In *The Motor Cycle* lately there has been some correspondence about "running without a magneto." Although I have not come across it in a motor cycle, I have had an "Evinrude" rowboat motor, which did so. This was entirely due to the water circulating pump ceasing to work, the motor then got overheated, and pulling the high-tension cable off would not stop it running. I do not think any petrol engine is capable of firing a charge by compression alone as "Valveless" suggests in his letter. He also says he thinks it would make a two-stroke motor four-stroke; this engine two-stroked all the time except that it went very slowly and stiffly. PERCY L. OGDEN.

Sir,—I was very much interested reading the letter written by "Valveless" on the above subject.

For a long time it has been my opinion that the Diesel principle of ignition has been responsible for a hot engine to continue firing, after the magneto has been cut out. And also that it is responsible for pre-ignition in a great many cases. Like "Valveless," I do not put myself forward as an advanced theorist, but as a keen observant motor cyclist. I will go a step further than "Valveless" and try to explain.

The theory of incandescent carbon is all right and acceptable if we can be persuaded that carbon or plug points will retain heat enough to fire the next charge after the passage of the piston through the power-stroke, exhaust-stroke, and the induction-stroke. It seems to me that the fact of the cooling influence of the incoming fresh gases would be enough to make the hot carbon ineffective on the next compression stroke; likewise the plug points to my mind would not be sufficiently incandescent to fire it. One would think if the carbon did retain sufficient heat to fire the next charge, why will it not continue to fire so long as there is carbon left for the flame to feed on?

But this is not what happens, it only continues to fire for a few seconds and stops. This is my case for the carbon theory. It may be wrong, and I shall be glad to stand corrected.

The Diesel system offers us another solution, and to my mind a more acceptable one for the simple reason that the carbon and plug points theory as far as I can see must be purely guesswork, whereas the Diesel principle of ignition is an established fact.

With a naturally high compression engine the combustion space further reduced by excessive carbon, the engine already hot from heavy running, engine otherwise in good condition as regards compression, etc.: I contend that under these conditions it is quite possible for this engine to run for a few revolutions on the Diesel principle, *sans* magneto.

Southport. J. MILNER.

Sir,—Anent this subject which appears to be interesting to so many observant motor cyclists, perhaps some enthusiast who has experimented with small petrol engines for driving model aeroplanes will give us details as to how the ignition worked on these small engines. Unless my memory fails me, it was the practice of certain pseudo-engineers who designed these diminutive power plants to have a high compression, and to start up by means of coil and battery. Having warmed up, this heavy equipment was disconnected and removed, and the engine flew off with its aeroplane, *sans* any special apparatus to make the spark. X.P.D.N.C.

Earlsdon.

SPEEDOMETER FITTING.

Sir,—The purpose of this letter is to call riders' attention to a small detail of fitting up speedometers, which has revealed a potential source of danger.

I recently took delivery of a new B.S.A. machine and sidecar, having had a speedometer fitted by the agents. At the end of the twelfth mile, while driving the machine home and while passing an overtaken vehicle, the front wheel became detached from the off side of the front fork, with disastrous consequences to the steering, the machine finishing up with the horse (with which I collided head on) dancing on the fortunately empty sidecar. The speed at the time was not more than 8 m.p.h.

On examination it was found that the near side of the front fork was bent to an angle of 45°, while the off side of the fork was still quite true. The wheel would still spin truly on the spindle, and was apparently unscratched. These details are mentioned in order that the cause of the accident may be seen clearly.

The front spindle nut is so shaped that it has a collar which fits into a circular rebate in the fork end for the purpose of preventing the spindle from coming out of the slotted fork end unless screwed back several threads. The agents in fitting the speedometer had merely slipped the clip holding the smaller toothed wheel over the collar on the nut and then screwed up.

The thickness of the speedometer clip is such that the collar of the nut, instead of projecting well into the rebate, was only in to a depth of about $\frac{1}{50}$in. The result was that the function of the rebate in the fork end and the collar on the nut was completely destroyed. The retention of the spindle in the slotted fork end must now rely entirely upon non-slipping of the nut when screwed up.

On recovering from the effects of the accident I called the attention of the agents and also the speedometer manufacturers to this palpable defect in fitting, and enquired for a special nut having a longer collar to accommodate the added thickness of the speedometer clip. To my surprise the agents informed me that it was the usual custom in the trade to fit speedometers as mine had been fitted, and also volunteered the information that unless a front spindle nut was screwed up with a hammer on the spanner it would loosen in the first fifty miles or so!

The speedometer manufacturers also seem unaware that a special nut is necessary! On the other hand, our local garage manager informs me that he would not dream of fitting a speedometer without a special nut. So until I can obtain the nut necessary to make a safe job, I remain

Tipton. SPEEDOMETERLESS.

TWO-STROKES.

Sir,—We think "A.L., Glasgow," loses sight of the fact that the two-stroke capacity is really much less than the stated capacity. The true c.c. of the simple three-port two-stroke engine, in our opinion, should be reckoned from the point where the piston closes the exhaust port. This will give the true c.c. For instance, in the Velocette the rated capacity by ordinary reckoning is 220 c.c., the bore and stroke being 62×73 mm. The effective stroke, *i.e.*, the amount of piston travel from the point where the piston closes the exhaust port to the top of its compression stroke, is equal to a volume of 165 c.c., that is lowering the capacity by 25%, which is quite sufficient handicap.

VELOCE LIMITED.
P. J. GOODMAN, Director.

Sir,—I think that "A.L., Glasgow," is prejudiced against the two-stroke engine. Do you not think that it ought to be encouraged on account of its great simplicity instead of discouraged, as "A.L." suggests. I think it is only fair to give it a few years to develop. Surely four-stroke enthusiasts are not afraid of it in its infancy.

Ibstock. H.P.C.

INDIAN KICK-STARTER.

Sir,—If your correspondent "Puzzled" will examine the kick starter pawl of his 7-9 h.p. Indian, he will find that this pawl carries a supplementary pawl, to release the main pawl when a reverse movement takes place.

I have had a similar experience with my 1914 Indian front starter, and, upon examination, found that the fine spring bearing upon the supplementary pawl had slipped its anchorage.

Since replacing this, I have had scores of backfires, as the 1914 Indian is, as far as road running is concerned, a fixed ignition machine, and consequently, when being started up, is inclined to early ignition.

If properly fitted, the supplementary pawl will release the main pawl within 3° reverse movement.

Broughton-in-Furness. 1914 7-9 h.p. INDIAN.

SUMMARY OF CORRESPONDENCE.

SATISFACTORY TREATMENT.—We have received a large number of letters of appreciation relative to the good treatment received at the hands of various garages and manufacturers. Among the firms mentioned are the following: The makers of the E.I.C. magneto, who replaced by return of post a magneto claimed to be defective; Ariel Works, Ltd.; the James Cycle Co.; and the makers of the Bonniksen speedometer, for similar prompt service. F.N. (England), Ltd., are also referred to in complimentary terms, while a discharged soldier—A. J. Biggs—who has opened a garage at Clarence Road, Southsea, is recommended on account of a prompt repair. The good work of the Euston Ignition Co., 329, Euston Road, London, on a rush job is the subject of another long letter, as is the promptitude of North and Sons, the makers of the Watford speedometer.

NOTES FOR THE NOVICE

CARBURETTERS III.

(Continued from page 188.)

THE problem of so constructing a carburetter that it shall give a perfect mixture at all throttle openings is not, I think, a very difficult one. The required proportions of air and petrol are known, and it is not difficult to produce a carburetter that will supply increased amounts of the two constituents of an explosive gas in the correct proportions either by increasing the suction on the jet, and so obtaining an increased amount of fuel as the air valve is opened, or by enlarging the jet by withdrawing a needle or uncovering extra holes.

A Perfect Mixture at Varying Speeds.

The second requirement, viz., that of giving a perfect mixture at different speeds with the same throttle opening, is by no means so simple. As the speed of the air through the carburetter increases, it naturally takes more petrol from the jet. If this is all, the proportion of air to petrol would continue to be correct, but greater engine speed also causes a higher vacuum in the carburetter, and consequently a greater suction on the jet. This also has the effect of taking up more fuel, and therefore, the fuel supply being increased for two reasons, the mixture becomes too rich, unless some method of counteracting this be incorporated in the carburetter.

In the Cox-Atmos carburetter this end is achieved by placing the jet in a small venturi tube of its own, instead of in the main venturi. The Eta attains the same purpose by means of an injector connected by a tube to the interior of the carburetter on the engine side of the venturi, but on the atmospheric side of the throttle. The single-lever Amac resembles both these to a certain extent, seeing that it has a passage between the jet and the venturi, and another to the engine side of the venturi which acts as a pilot jet. In all three the controlling valve or jet is removed from the spraying jet. The Claudel-Hobson venturi tube is supplied with the usual jet, and this is surrounded by an annular space where air can enter as the suction increases, and keep the mixture uniform at different speeds. This carburetter has, in addition, an adjustment of the air supply controlled by a small lever on the side of the carburetter, by means of which a rich mixture can be given for starting purposes. When the engine is in motion the lever can be set to give the amount of air required by the fuel in use, or the atmospheric conditions prevailing at the time, but it need not be touched while driving.

The novice is very likely to form the opinion that he will obtain greater power by enlarging his jet and greater economy by reducing it. Although both of these opinions are broadly correct, they do not apply to every case. If the mixture be too weak a larger jet will naturally increase the power, but if the carburetter is already giving a perfect mixture no advantage will accrue from the use of a larger jet unless the air supply is also increased, and consequently an increased charge got into the engine—in fact the reverse will be the case, for the mixture will become too rich and will not burn so quickly, or exert so great a force upon the piston, the inside of the engine will become coated with a fine soot, the plugs will be sooted up, and misfiring will result.

Jet Sizes and Economy.

On any given engine the advantage of increasing both the jet size and the air supply is strictly limited, for it is essential to keep up the air velocity through the carburetter, and so promote suction turbulence, and this can only be done by having a choke tube of a reasonable size. Too large a choke combined with too large a jet may give a perfect mixture, but no more gas will enter the cylinder than if the air velocity were higher and the jet smaller, and the suction turbulence, which is so necessary to rapid combustion, would be lacking to a large degree.

Similarly a reduction of the jet size must be accompanied by a corresponding reduction in the air orifice, and consequent increase of air speed, so that we soon arrive at a point where a further decrease in the size of the jet no longer effects an economy of fuel, for the air must be kept closed and the throttle more open, and we have in effect a smaller carburetter working at a greater throttle opening. As a matter of fact it is sometimes possible to improve the m.p.g. by slightly enlarging the jet.

Notes for the Novice.—

Again, when using benzole in a carburetter tuned for petrol it is better in the interests of economy to reduce the jet than to increase the air supply, though it is not always so convenient to adopt this procedure. This is where the advantage of a variable jet is so apparent. To give an example—a month or so ago I was obliged to fill up my tank with petrol when my single lever Amac was tuned for use with benzole. This gave quite satisfactory running on the level, and on moderate hills, but on the steep grade of Birdlip the engine seemed to lack its usual power. However, a very slight opening of the W.S.R. jet made a world of difference. I passed the Knapp (1 in 5) and finished the climb in no uncertain fashion and with plenty of speed.

It is a very good plan when testing jet sizes to examine the plug (or plugs) at frequent intervals, and to cut down the jet size at the slightest sign of soot—not burnt oil, which may be wet or hard, but powdery black soot, such as can be easily wiped off with a rag or brush.

The Float Chamber.

The petrol level at the jet is controlled by the level in the float chamber, and, although this is always supposed to be correctly set by the makers of the carburetter before the instrument leaves the works, I have met with but few carburetters where the economy could not be improved by lowering the level a trifle. An easy means of adjusting the level is therefore very desirable, and preferably one which will allow the level to be set back to its former height, should the alteration not prove beneficial. In some cases where the needle has a brass collar, the collar can be moved up or down as required, but great care must be taken not to damage the point of the needle. In top feed carburetters and those having bottom feed with an inverted needle (such as the Amac), the collar must be lowered to lower the petrol level, and naturally in cases where the needle is operated by toggles, as the float rises, the collar must be raised to attain the same result. In some carburetters a slot turned on the needle takes the place of a movable collar, in which case the level can be lowered by placing a very light washer or ring (of aluminium, if such is obtainable, but a brass boot eyelet will do very well) under the spring clip above the float, or the level raised (but this is seldom necessary) by means of a heavy washer above the clip. Personally, I prefer these methods to tampering with the collar, as there is no chance of doing any damage, and they allow of an immediate and certain return to the original conditions if desired.

Effect of Level.

Some carburetters—*e.g.*, the Senspray—admit of a very low petrol level owing to the principles of their construction; others are much more sensitive to level. Generally speaking, a low level tends to economy, but makes starting a little more difficult, while a high level is beneficial for slow running. It need hardly be said that the highest allowable level must be below the orifices of the spraying jet, or flooding and waste of fuel will result.

I have occasionally met with carburetters in which the only method of altering the level of the fuel at the jet was by tilting the whole carburetter, since there was, owing to its construction, no convenient method of altering the level in the float chamber. This I consider to be a defect in design. J.H.W.

WHERE OLD-WORLD CUSTOMS STILL PREVAIL—BELGIUM, 1920.

A typical Belgian village scene. A bullock cart in St. Trond.

CLUB NEWS.

Coventry and Warwickshire M.C.

Local motor cyclists wishing to join the club in order to participate in the hill-climb at Stile Kop on September 4th should communicate at once with the hon. secretary, Mr. J. F. Spencer, 27, Priory Street, Coventry.

Helensburgh M.C.C.

Owing to lack of entries for the recent hill-climb held on Garshake Hill, Dumbarton, several of the classes were cancelled. The results of those run off were as follow: Class 2 (600 c.c.).—1, E. N. White (3½ Edmund); 2, D. C. Tullis (3 A.B.C.). Class 4 (sidecars).—1, W. M. McLellan (4 Norton sc.). Class 6 (600 c.c., novices).—1, W. M. Carlaw (3½ Lea-Francis); 2, T. Godley (3½ Rudge).

Colwyn Bay, Llandudno, and District M.C.C.

A club has recently been formed in the above district. All motor cyclists desirous of becoming members should get into communication with the hon. sec., Mr. R. H. Jones, "Greenfield," St. David's Road, Llandudno, or the hon. treasurer, Mr. D. R. Clarke, "Holmleigh," Woodland Park, Colwyn Bay.

Essex M.C.

Further particulars are now to hand concerning the Essex Motor Club's Twenty-four Hours Trial, which promises to be a most interesting event, embracing as it does two of the famous hills situated in the neighbourhood of Bala.

The start will take place from the "Old Gatehouse," Highgate, on September 10th, and the route will pass through Barnet, Daventry, Tamworth, Shrewsbury, Welshpool, and Bala. Having partaken of breakfast at Bala, competitors will ascend the Hirnant Pass, well remembered by competitors in the 1919 Six Days A.C.U. Trials, descending into Llanwyddyn and along the shores of Lake Vyrnwy. Thereafter the route proceeds *via* Cann Office to Shrewsbury, Tamworth, Daventry, to Dunstable, making a total mileage of 410 miles.

Entries close on August 28th, and full particulars can be obtained from the hon. organisers, F. A. Applebee and E. A. Colliver, 208, Great Portland Street, London, W.1.

Basingstoke M.C. and L.C.C.

A large crowd of spectators assembled to witness the club's recent hill-climb on Farleigh Hill. The weather was ideal, and the organisation very well carried out. Forty-seven competitors took part in the various classes, which were run off without a hitch, and some good riding was witnessed. The results on formula were as follow: 275 c.c.—1, W. Julian (Cedos); 2, T. Mansbridge (Metro-Tyler). 350 c.c.—1, C. Ody (2¾ Douglas); 2, S. Ody (2¾ Douglas. 550 c.c.—1, W. Julian (A.B.C.); 2, S. Julian (3½ Norton). 1,000 c.c.—1, W. Julian (A.B.C.); 2, S. Julian (3½ Norton). 600 c.c. sidecars.—1, S. Julian (3½ Norton sc.); 2, W. Julian (3½ Norton sc.). Light cars.—1, R. Baxter (A.V.). Fastest solo, F. Bickerton (Indian), 33⅖s. Fastest sidecar, S. and W. Julian tied, 43⅗s.

Future Events.

Aug. 19.—Worcester and District M.C.C. Hill-climb.
Aug. 21.—Plymouth and District M.C. and L.C.C. Run to Okehampton.
Aug. 21.—Southampton and District M.C. Trials for Club Cup.
Aug. 21.—Falkirk and District M.C.C. Hill-climb.
Aug. 21.—Dewsbury and District M.C.C. Competition.
Aug. 21.—Sheffield and Hallamshire M.C.C. Petrol Consumption.
Aug 21.—Edinburgh and District M.C. Run to Gifford.
Aug. 21.—Eastern Valley M.C.C. Run to Malvern.
Aug. 21.—Bedford and District M.C. and L.C.C. Club Run.
Aug. 21. Luton and S. Beds. A.C. Picnic.
AUG. 21.—YORK AND DISTRICT M.C. OPEN EVENT, SUTTON BANK.
Aug. 21-22.—Public Schools M.C.C. Week-end Run.

AUG. 23-28.—A.C.U. SIX DAYS TRIALS.
Aug. 24.—Plymouth and District M.C. and L.C.C. Reliability Trial.
Aug. 25.—Leeds and District M.C. Run to Buttercombe.
Aug. 25.—Southampton and District M.C. Run to Barton-on-Sea.
Aug. 26.—Nuneaton and District M.C.C. Run to Copstone.
Aug. 26.—Eastern Valley M.C.C. Slow Hill-climb.

Southport A.C.

The Southport Automobile Club is holding a speed trial on August 28th, to be run on the Southport sands. There will be ten classes for motor cycles and two for cars. Full particulars can be obtained from Mr. E. Jones, 33, Morven Grove, Southport.

North London M.C.C.

The North London M.C.C. were the organisers of a well-attended flying meet held at Northolt Aerodrome on the 8th inst. Flights were obtainable at reduced rates, and a raffle which was arranged resulted in six lucky numbers securing a guinea flight in an Avro machine at a cost of a shilling each. The visiting clubs were the Stevenage and District, Bedford, Marlow and District, and N.W. London.

Taunton and District M.C.C.

Following up the recent successful events of this club a hill-climb is fixed for to-day at West Buckland Hill, near Wellington, and the first event is timed for 3 p.m. There are twelve classes in all, six for the Taunton Club only, and six for members of the Bournemouth, Bridgwater, Dorchester, Exeter, Sidmouth, Taunton and Yeovil M.C.C. The results will all be on time, and prizes are to be given as follow—one in every class, two if five or more starters, three if eight or more starters.

Warrington M.C.

Last month a reliability trial was held over a very severe course 185 miles in length, including Bwlch-y-Groes, reputed to be the stiffest climb in England and Wales, for the Melbourne Challenge Bowl and other valuable prizes. Out of the thirty competitors who faced the starter, only twelve checked in at the finish without having lost any marks.

Protests were received from two of the competitors, an error being discovered in the watch used to check the competitors in at the finish. It was therefore decided to re-run the trial over a short but very severe course in Wales on August 7th, only those who completed the original course without loss of marks being allowed to compete. Results:

Melbourne Bowl and First Prize.—J. H. Green (6 Martinsyde-Newman sc.), 100 marks.
Second Prize.—F. Parker (7-9 Indian sc.), 96 marks.
Third Prize.—B. Caldwell (3½ Norton), 95½ marks.
Gold Medal.—W. Jackson (4 Triumph), 91 marks.
H. A. Leach (4 Douglas), 90½ marks.
D. W. Beck (3½ Sunbeam), 87 marks.
R. S. Jackson (4 Triumph), 81 marks.
J. Roberts (6 A.J.S. sc.), 80 marks.

Competitors on the Scottish coast route in the recent York-Edinburgh-York trial. The leading rider is B. Jefferys (4 Norton sc.), who won a cup in the sidecar class.

CURRENT GAT

Times to Light Lamps.

Aug.	19th	... ...	8.45 p.m.
,,	21st	... ...	8.41 ,,

,,	25th	... ...	8.32 ,,

Found.

Mr. A. E. Barrett, 323, St. John Street, Clerkenwell, recently picked up a motor cyclist's new waterproof jacket.

Police Persecution.

According to a daily newspaper, a motor cyclist was recently summoned at York for allowing exhaust gas to escape from his motor cycle.

One of the British Team.

We understand that the reason S. Barron, who was entered for both the International and the Anglo-Dutch trials, failed to reach Grenoble was that he broke his sidecar axle near Paris on the way to the French Alps.

Fixing Accessories.

One frequently comes across riders who have such things as tool bags and spare belts flapping about their machines. Because a spare tube case got jammed between the back wheel and the carrier of his machine, a well-known Wellingborough motor cyclist recently met with a serious accident.

Imports and Exports.

Last month (July) there was a considerable increase both in the importation and exportation of motor cycles. Imports showed a very big increase, the figures being nearly double those of June, but in cars, curiously enough, there was a slight reduction.

IMPORTS FOR JULY.

	1913	1919	1920
No. of motor cycles	82 ..	27 ..	666
Value, including parts and accessories	£ 14,074 ..	£ 2.586 ..	£ 51.179

EXPORTS.

To find an actual increase of £116,492 in motor cycle exports, against the previous month, is satisfactory indeed, the total amount for July being £271,078. In 1913 the figures for the same month were £92,178, so that even allowing for the difference in the value of the £, the recent progress made in our overseas trade would, on the face of it, appear to be decidedly good.

EXPORTS FOR JULY.

	1913	1919	1920
No. of motor cycles	1,621 ..	501 ..	2,641
Value of motor cycles	£ 71,287 ..	£ 33,521 ..	£ 203,849
Value of motor cycles, including parts and accessories	92,178 ..	50,773 ..	271,078

Motor Cycle Police v. Car Burglars.

Police Inspector Brunning, of Bromley, Kent, who on his three-year-old standard Douglas overhauled and captured burglars on a 30 h.p. car, after a five mile chase on the London Road, is an old motor cyclist. For several years he owned an Enfield sidecar outfit. He is a divisional police inspector, not a detective. Motor cycles are not yet issued to detectives, but no doubt will be as their value is realised.

The Scottish Two Days Trial.

Already there has been a ready response in the way of entries for the Scottish Two Days Highland Trial to be held September 18th to 20th, and announced in *The Motor Cycle*. The competitors leave Edinburgh at 7.30 on the Saturday morning for Oban, where Sunday is to be spent, from which resort the competitors return on Monday. The following entries have so far been received :

R. S. Macrae (Harley sc.).
N. D. Cran (7-9 Harley solo).
H. Mortimer Batten (P. and M.).
Harry E. Fairley (A.B.C. sc.).
Mrs. Olive M. Knowles (4 Norton).
R. M. Knowles (4 Norton).
G. H. Moir (Harley sc.).
George Grinton (Harley sc.).
James Steel (3½ Norton).
W. Lyle (Harley sc.).
A. H. Fairley (American X).
Baxter Norton (——).
Mrs. Duncan Bell (6 A.J.S. sc.)
Hugh Gibson (Clyno).
James Beck (3½ Sunbeam sc.).

Full particulars of this event can be obtained from Mr. Graham Davidson, hon. sec. Edinburgh and District M.C.C., Ltd., 6, Castle Terrace, Edinburgh.

Special Features.

NEXT WEEK'S BIG TRIAL.
IMPRESSIONS OF THE ANGLO-DUTCH TRIAL.

Carburetter Controls.

The lack of standardisation in carburetter controls was, in the opinion of a coroner's jury, responsible for a fatal accident in Norfolk recently.

20,000 Gallon Petrol Fire.

20,000 gallons of petrol were destroyed by fire at the Anglo-American Company's Bromley depot. The fire followed two other outbreaks in a month at the Bickey depot close by.

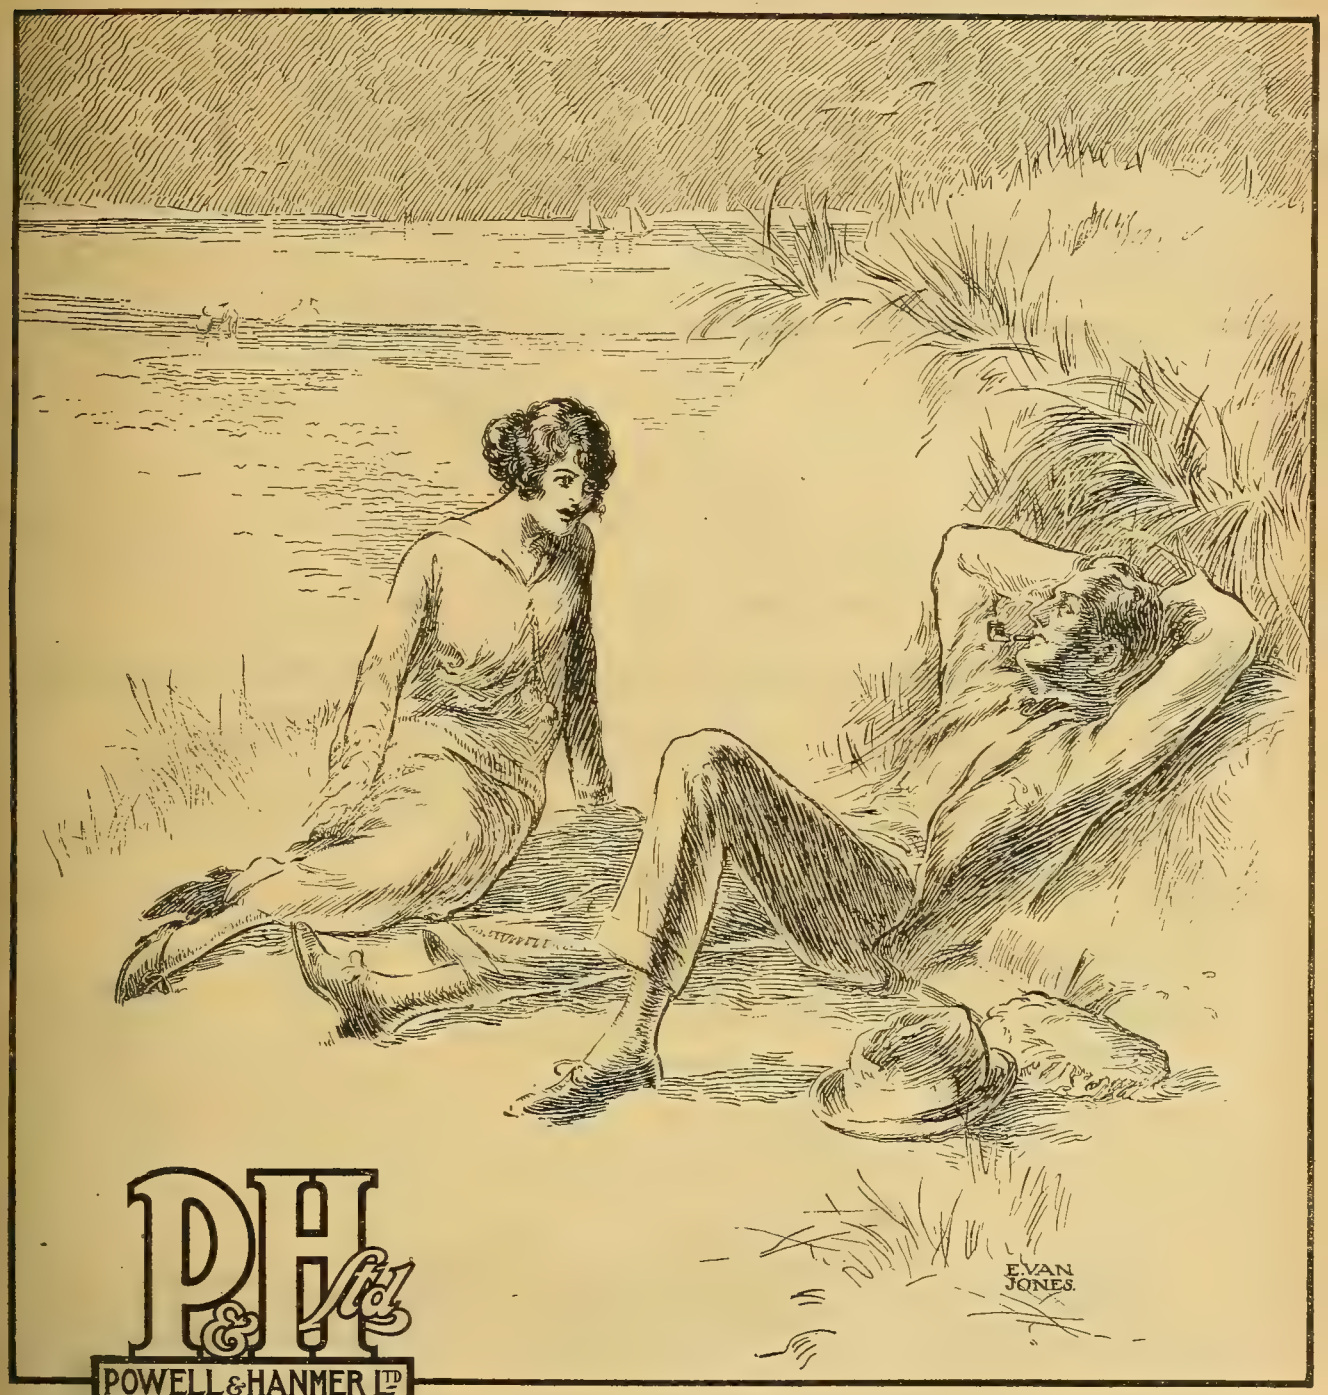
New Types in the Six Days.

Two three-cylinder radial engined machines are entered for the A.C.U. Six Days Trial. These are the Redrup, of which a description was given in our issue of Feb. 5th, 1920. Another interesting machine entered is the 500 c.c. two-stroke Dunelt, shown at the last Olympia Show, and which is now emerging from the experimental stage.

An Extensible Rear Lamp.

The idea (illustrated on page 153 of our issue of August 5th) of carrying a rear lamp on the sidecar, using an extensible bracket to bring it to the off side of the vehicle when in use, is protected by the reader who submitted it. He is willing to negotiate with any manufacturer interested in its commercial possibilities.

A miniature aeroplane, occupying in the aviation field the same place as the lightweight motor cycle in the world of wheels. The machine, which weighs 2 cwt., has been built by M. Pischoff, and is fitted with a Clerget flat twin engine of 16 h.p.

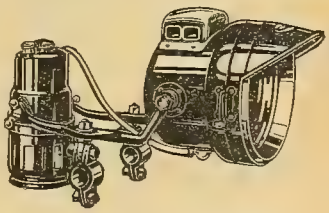


P&H Ltd.

POWELL & HANMER LTD

BIRMINGHAM

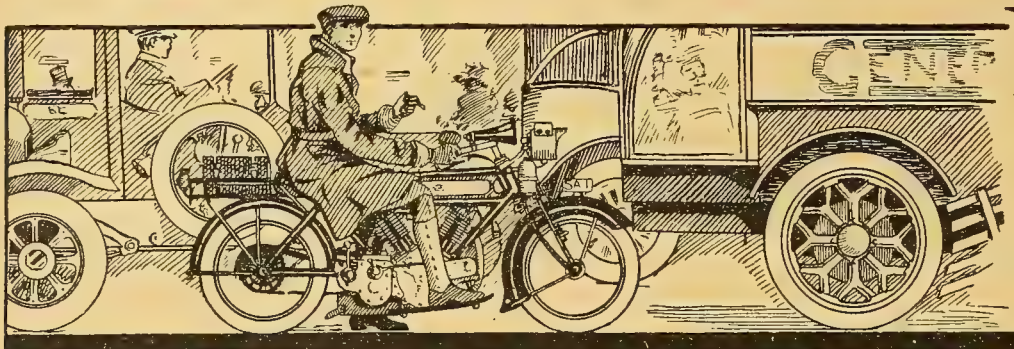
"But we can't go all that way back in the dark"—Why not? There's no need to worry at all with those "P. & H." LAMPS, you can ride as SAFELY by NIGHT as by DAY. They are absolutely ***the thing*** in Lighting Sets, giving a steady beam of clear white light for some distance ahead, and you spin along in comfort and safety.



Enjoy all your happy summer days to the full with an easy mind about the night ride home by using

"P. & H." LAMPS

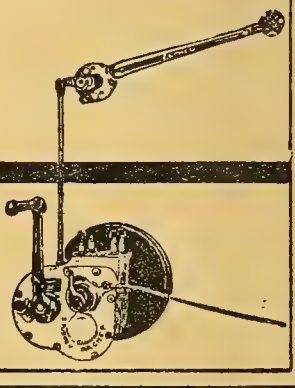
No. 127 H B.
PRICE - 80/-.



For the Traffic "crawl"

You know that crawl—when you've got to get down to a slow walk and then suddenly sprint at record speed. There's only one way of doing it—to have a Sturmey-Archer on your machine. Slip in the gear occasion warrants, and you have 2 or 50 miles an hour at your will.

Sturmey-Archer Gears, Ltd., Nottingham.



STURMEY-ARCHER COUNTERSHAFT GEAR

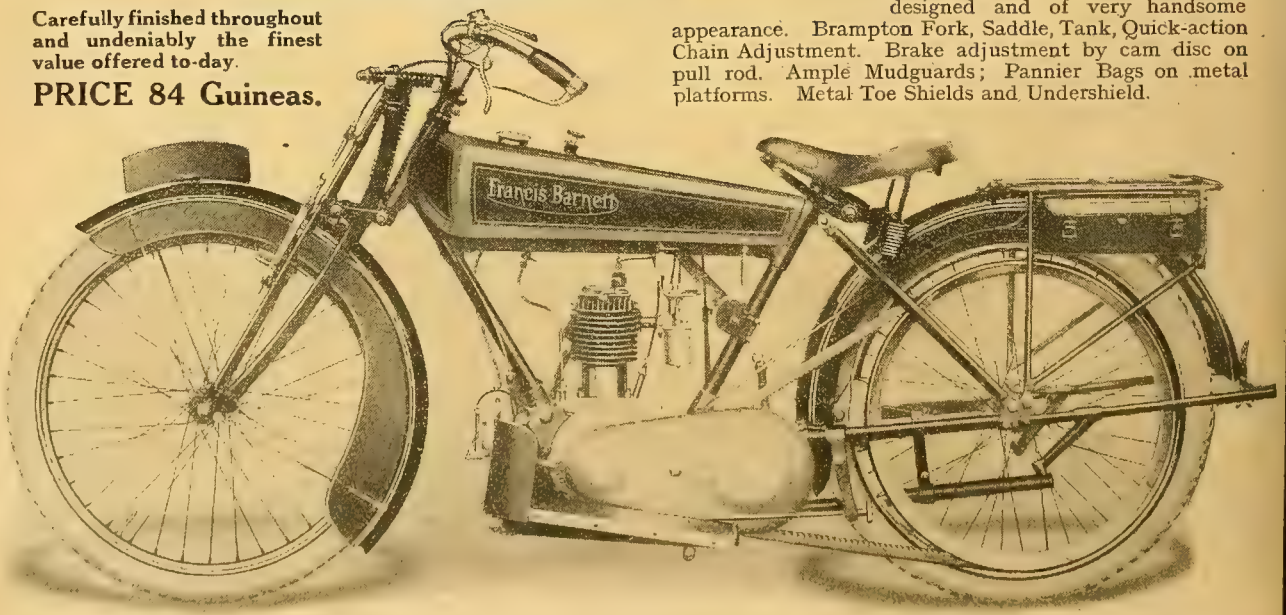
Francis-Barnett

THE SUPER LIGHTWEIGHT

2¾ h.p. Jap Engine, Sturmey-Archer Two-Speed Gear, with Clutch and Kick Starter. Frame specially designed and of very handsome appearance. Brampton Fork, Saddle, Tank, Quick-action Chain Adjustment. Brake adjustment by cam disc on pull rod. Ample Mudguards; Pannier Bags on metal platforms. Metal Toe Shields and Undershield.

Carefully finished throughout and undeniably the finest value offered to-day.

PRICE 84 Guineas.



Overseas enquiries for Sole Agencies solicited.

FRANCIS & BARNETT, Ltd., *Works:* Lower Ford St., COVENTRY.

Police Activity in the Metropolis.

We learn that there is a police trap working on the Golder's Green-Tally Ho Road, Church End, Finchley, between Redbourn Avenue and Long Lane. A plain clothes policeman is stationed at Redbourn Avenue end.

Cup for Ex-D.R.'s.

Among the several special prizes in next week's Six Days Trial is a cup presented by Brigadier-General E. G. Godfrey Fausset, C.B., C.M.G., on behalf of the Signal Service Association. This is for the best performance in the trial by an ex-D.R.

Chatsworth Park Speed Trials.

The provisional results given on page 202 of last week's issue have been confirmed by the organising committee with a few exceptions. In Class 4 G. E. Hobart (5-6 James) is now placed third. Class 13, G. S. Boston (2¾ A.J.S.) is placed first instead of G. Dance, who takes second place; G. Grunton (7-9 Harley-Davidson) being third. In Class 14 G. Dance is second instead of G. Grunton, who now figures third; and in Class 17 G. Dance takes second, with V. Horsman (3½ Norton) third, the positions in Classes 18 and 19 being altered in the same way.

As regards the fastest time of the day, this is now given as a tie between G. S. Boston (A.J.S.) and G. Dance (Sunbeam).

In each open class there was a gold medal for the fastest time by private owner, and this brings Boston's total of gold medals to 15 and second private owner twice out of seventeen classes.

The East Midland Centre A.C.U.—the organisers—also gave "county" medals for members in different counties. The winners of these are as follow:

Yorkshire.—F. W. Dixon, York.
Derbyshire.—R. Carter, Chesterfield.
Nottinghamshire.—G. W. T. Hartwell and R. Lucas, tied.
Leicestershire.—H. Petty, Loughborough.
Lincolnshire.—L. W. Forington, Boston.

L. Runton making the fastest time at the Hull M.C.C. hill-climb last Saturday. The machine is an A.B.C.

North-Western Centre Hill-climb.

It is proposed to hold a hill-climb at Heyden Bridge on September 12th, open to all clubs in the North-west centre of the A.C.U., provided that satisfactory arrangements can be made; also on September 26th it is intended to run a reliability trial over a secret course of 100 miles. Further details of these events will be published later.

"The Motor Cycle" and the Six Days Trials.

As usual in the case of all important trials, members of *The Motor Cycle* editorial and photograph staffs will journey with the competitors throughout the A.C.U. Six Days Trials. Impressions of the start will appear in our next issue, and a fully illustrated description of the event will be published in *The Motor Cycle* dated Thursday, September 2nd.

A TWENTY-FOUR HOUR CLUB RUN.

Members of the Hull M.C.C. crossing the Humber during their recent reliability trial to London and back. The winner was H. Scarlett (3½ Rudge), standing second from left

Fifteen o'Clock.

One interesting feature of the A.C.U. Six Days Trial is that competitors will ride to times quoted on the service system. It will be strange to many to follow route card times which, for example, show that Langcliffe is to be reached at 15.5½ o'clock.

The Black Prince.

We are informed that A. G. Cocks—and not the late E. W. Cameron, of Askern—is the designer of the Black Prince runabout, and that the single plug flat twin engine is the patent of H. Singleton, of Liverpool. Mr. Cameron's efforts were chiefly concerned with the pressed steel construction of the Black Prince frame.

Riders as Designers.

Acting on the suggestion contained in "Ixion's" contribution last week, Messrs. Clifford Wilson Manufacturing Co., 70, Royal Hospital Road, Chelsea, are offering prizes for the best suggestion by a Quadrant owner for the improvement of the 1920 model of this well-known make of machine.

Second-hand Prices.

In order that readers may follow the general trend of the second-hand market, a list is given below showing the current highest and lowest prices asked by advertisers.

	Highest and Lowest.
A.B.C., 3 h.p., 4-speed, 1920	£135–£150
A.J.S., 6 h.p., sidecar, 1919-20	£165–£230
Alldays Allon, 2¾ h.p., 2-speed, 1915-16	£50–£55
Ariel, 3½ h.p., 3-speed, sidecar, 1919-20	£105–£150
Blackburne, 4 h.p., sidecar, 1920	£140–£165
B.S.A., 4½ h.p., 3-speed, sidecar, 1918-19	£105–£138
Calthorpe-Jap, 2¾ h.p., 2-speed, 1915-16	£40–£45
Clyno, 2½ h.p., 2-stroke, 1920	£65–£75
Coulson-B., 2¾ h.p., 1919-20	£79–£99
Diamond-Jap, 2¾ h.p., 2-speed, 1919	£68–£72
Douglas, 2¾ h.p., 2-speed, 1914-16	£10–£68
Douglas, 4 h.p., sidecar, 1917-18	£8?–£110
Enfield, 6 h.p., sidecar, 1916-17	£128–£145
Harley-Davidson, 7-9 h.p., sidecar, 1917-19	£135–£165
Indian, 7-9 h.p., Powerplus, sidecar, 1918-19	£115–£175
Matchless, Model H, sidecar, 1920	£200–£238
Matchless, Victory Model, sidecar, 1919	£140–£175
New Imperial Jap, 2¾ h.p., 2-speed, 1915-16	£45–£52
Norton Big 4, sidecar, 1919-20	£165–£200
P. & M., 3½ h.p., 2-speed, 1918-19	£65–£90
Rover, 5-6 h.p., sidecar, 1919-20	£160–£225
Sunbeam, 3½ h.p., 1918-19	£140–£165
Triumph, 3½ h.p., 3-speed, 1914-15	£55–£65
Triumph, 4 h.p., sidecar, 1920	£155–£170

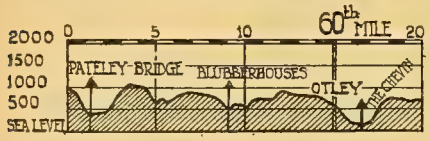
A Guide to the A.C.U. Six Days Event, starting from Darlington on Monday next. Complete List of Competitors and their Numbers. Each Day's Timetable.

FROM our knowledge of the routes chosen for next week's A.C.U. Trials, we can prophesy that the 120 competitors will have no touring holiday. This year, no doubt, there will be a larger gathering of interested spectators at various points of the route, if only on account of the more populous districts through which the routes lie. Further, on Friday of next week, the competitors will journey from the North to the Midlands, concluding the trial on the following day with a run to Brooklands for the speed test and final examination. The preliminary examination takes place at Darlington on Sunday next.

For the benefit of those readers who wish to see the entrants at various points of the course, we append below a timetable, showing the times at which the first competitor is due at the places mentioned.

Monday's Programme.

The first day's run is comparatively easy. A southerly route is taken, and the foothills of the Pennines entered after passing through Masham. From there a direct road is taken through Pateley Bridge and Blubberhouses to Otley, where, after climbing the Chevin, the route runs westwards to Keighley and over Rombolds Moor into Ilkley, the first lun-



MONDAY MORNING: An undulating route, not freakish, but with stiff gradients

cheon stop. After lunch a by-road is taken joining the main road at Bolton Abbey and proceeding up Wharfedale to Kettlewell. From Kettlewell the steep ascent known as Park Rash is taken over the Moors, into Wensleydale, the homeward journey being through Redmire and Richmond.

Timetable for Monday.

MORNING.—Darlington 8. Croft 8.12. Great Smeaton 9.30. Northallerton 8.52½. Bedale 9.18. Masham 9.37. Kirkby Malzeard 9.52. Pateley Bridge 10.19. Blubberhouses 10.42. Otley 11.5. Guiseley 11.18. Bingley 11.41. Ilkley 12.15. (1h. 15m. lunch stop at the Middleton Hotel.)

AFTERNOON.—Ilkley 1.30. Bolton Abbey 1.49½. Grassington 2.26. Kettlewell 2.43½. Carlton 3.26. West Witton 3.44. Thoralby 3.59. Redmire 4.15½. Richmond 4.50. Middleton Tyas 5.4. Croft 5.20. Darlington (Victoria Rd.) 5.31.

Tuesday's Run.

On Tuesday the route is again in the Pennines and is a succession of long and short climbs over the Yorkshire moors. After passing just to the north of Richmond, Swaledale is followed as far as Crackpot, where the road bears to the south over Askrigg Common, doubling back on itself across Swaledale up on to Arkengarthdale Moor. After passing through Keld and Thwaite, Wensleydale is crossed at Hawes, and the road running

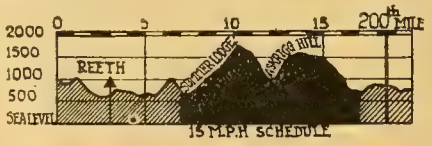
MONDAY AFTERNOON: Park Rash is included, one of the most difficult hills in the country.

up Widdale is followed until the watershed is crossed at Newby Head. From Dent the well-known trials route over White Shaw Moss is followed until Ingleton is reached for lunch. After lunch the first point of interest is the tunnel at Clapham, and then the steep climb up to Malham Tarn after passing through Langcliff. The grass-covered hill at Darnbrook House will prove difficult if the weather should happen to be wet, and thereafter nothing very difficult is met with on the homeward journey through Kettlewell, Askrigg, and Richmond.

Timetable for Tuesday.

MORNING.—Darlington (Skinner Gate) 8.0. Barton 8.17. Reeth 9.9. Feetham 10.11. Hawes 11.34. Dent 12.16½. Ingleton 12.59½. (1.30½m. lunch stop at Ingleborough Hotel.)

AFTERNOON.—Ingleton 2.30. Clapham 2.44. Stainforth 3.0½. Langcliffe 3.5½. Arncliffe 3.44. Kettlewell 4.1. Buckden 4.11½. Stalling Busk 4.37½. Bambridge 4.46½. Askrigg 4.51½. Redmire 5.13. Richmond 5.48. Middleton Tyas 6.5½. Croft 6.18½. Darlington (Victoria Road) 6.29.



TUESDAY MORNING: The descents on this section will test brakes to the utmost.

The Third Day.

For the third day the trial lies in the Cleveland Hills, but, unfortunately, a considerable distance of uninteresting country has to be traversed at each end of the day's run. After passing through Stockton-on-Tees and Guisborough, a turn southwards is made through Castleton on to Glaisdale Moor. After descending gently to Rosedale Abbey, the road suddenly rises on to Spenton Moor, this ascent is probably the most difficult in the trial. Nothing further of interest occurs before lunch at Thirsk, but in the afternoon the first thirty-five miles are all difficult going, and include numerous watersplashes. High ground is gained by the climb up Boltby Bank, from which point the run is approximately northwards until the plains are again reached at Ingleby Greenhow.

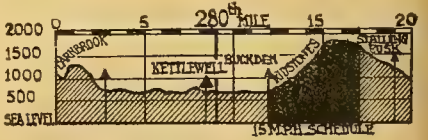
Wednesday's Timetable.

MORNING.—Darlington (Haughton Road) 8.0. Long Newton 8.16. Stockton-on-Tees 8.29½. Thornaby-on-Tees 8.32. Guisborough 9.18. Castleton 9.46. Hutton-le-Hole 10.28½. Kirby Moorside 10.37½. Lawton 10.46½. Helmsley 10.55. Kilburn 11.22. Bagby 11.35. Thirsk 11.45. (1h. 45m. lunch stop at Three Tuns Hotel.)

AFTERNOON.—Thirsk 1.30. Felix Kirk 1.40. Boltby 1.46½. Hornby 2.4½. Swainby 2.48½. Carlton 2.58. Ingleby Greenhow 3.28½. Stokesley 3.43. Crathorne 4.4. Yarm 4.7. Darlington (Park Gate) 4.44.

The Last Day in the North.

On Thursday a circular route is taken with Penrith as the object. The roads



TUESDAY AFTERNOON: Darnbrook will prove almost unclimbable if wet.

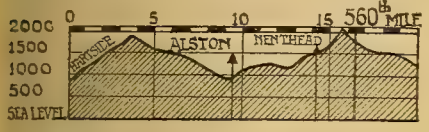
in the morning, although probably trying to the ordinary tourist, are not particularly difficult, whilst in the afternoon much of the run is over the same country as was traversed in the 1913 trials. Penrith is reached by way of Middleton-in-Teesdale, Kirkby Stephen, and Shap, and left by the direct road over Hartside to Alston, the highest town in England, and from there by a somewhat circuitous route over the moors of South Durham back to Darlington, thus ending the northern section of the trial.

Timetable for Thursday.

MORNING.—Darlington (Bond Gate) 8.0. Staindrop 8.33. Eggleslone 9.3. Mickleton 9.10½. Brough 9.54½. Kirkby Stephen 10.7½. Soulby 10.15. Crosby Ravensworth 10.51. Shap 11.3. Clinton 11.27. Penrith 11.36. (1h. 24m. lunch stop.)

AFTERNOON.—Penrith 1.0. Langworthy 1.14½. Melmerby 1.27. Alston 1.58½. Nenthead 2.13. West Gate 2.52½. Bolt's Burn 3.7½. Wolsingham 4.13. Tow Law 4.23½. Crook 4.37. Bishop Auckland 4.53½. Darlington (Bond Gate) 5.36.

On Friday the run southwards is commenced, but the familiar Great North Road is left severely alone except for some five miles north of Catterick. From Catterick a by-road is taken up Coverdale and down Park Rash into Kettlewell. After Kettlewell the direct road to Ilkley is followed, and from there Monday's run is repeated in a reverse direction as far as Harden. After climbing Harden Bank the industrial district to the west of Bradford is traversed.



THURSDAY AFTERNOON: The highest point in the trial (2,000 ft.) is reached.

Friday's Timetable

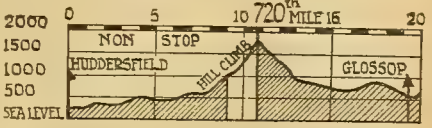
MORNING.—Darlington (Skinner Gate) 8.0. Barton 8.17½. Catterick Bridge 8.37½. Hunton 8.57. Middleham 9.17½. Carlton 9.31½. Kettlewell 10.3. Threshfield 10.21½. Bolton Abbey 10.50½. Ilkley 11.7½. Brighouse 12.9. Huddersfield 12.22½. (1h. 7½m. lunch stop.)

AFTERNOON. — Huddersfield 1.30. Glossop 2.28½. Buxton 3.11½. Ashbourne 4.13. Sudbury 4.43. Yoxall 5.10. Lichfield 5.30. Coleshill 6.16. Stonebridge 6.28½. Kenilworth 6.55½. Warwick and Leamington 7.9

The Last Day.

On Saturday the road work is of an easy nature, and Brooklands is reached in time for lunch, immediately after which the brake test will be held, followed by the half hour's run at speed and the final examination.

Coleshill 8.0. Stonebridge 8.12. Kenilworth 8.39. Warwick and Leamington 8.52½. Banbury 9.52. Oxford 11.0. Henley-on-Thames 12.9. Maidenhead 12.35. Windsor 12.55. Staines 1.13. Chertsey 1.22. Brooklands 1.40½.



FRIDAY AFTERNOON: The timed hill-climb is taken non-stop after nine miles climbing.

LIST OF ENTRANTS FOR THE SIX DAYS TRIALS.

CLASS A.—SOLO MACHINES UNDER 275 C.C.

No. and order of starting.	Entrant and Machine.	Driver.	Cubic Capacity.
1	Reg. H. Baxter (2¼ Radco)	Entrant	211
2	Butterfields, Ltd. (2½ Levis)	F. W. Applebee	247
3	S. Jones (2¼ Velocette)	Entrant	220
4	Humphreys and Dawes (2½ O.K. Junior)	N. M. Hall	246
5	Enfield Cycle Co. Ltd. (2¼ Royal Enfield)	H. L. Hanks	225
6	Veloce, Ltd. (2¼ Velocette)	G. Denley	220
7	Humphreys and Dawes (2½ O.K. Junior)	W. L. Handley	246
8	Butterfields, Ltd. (2½ Levis)	Gus Kuhn	247
9	James Cycle Co., Ltd. (2¼ James)	J. F. Lidstone	239.5
10	Veloce, Ltd. (2¼ Velocette)	E. F. Goodman	220
11	Butterfields, Ltd. (2½ Levis)	F. Porter	247
12	Clyno Eng. Co., Ltd. (2½ Clyno)	C. V. Freeman	269
13	H. P. Knowles (2¾ Hobart)	Entrant	269
14	Clyno Eng. Co., Ltd. (2½ Clyno)	H. Gibson	269

CLASS B.—SOLO MACHINES UNDER 350 C.C.

15	R. Gold (2⅞ Wolf)	Entrant	293
16	B. Kershaw (2¾ Verus)	Entrant	350
17	J. A Newman (2¾ New Imperial)	Entrant	292.4
18	D.F. and M. Eng. Co., Ltd. (2½ Diamond)	F. J. Price	293
19	R. B. Clark (2¾ Coulson)	Entrant	349
20	Beaumont Motors, Ltd. (2⅞ Redrup Radial)	N. A. Woolley	309
21	C. B. Redrup (2⅞ Redrup)	Entrant	309
22	J. W. Wills (2¾ Verus)	Entrant	348
23	Hoskison Motors, Ltd. (2⅞ Hoskison)	H. R. Guest	349
24	F. E. Baker, Ltd. (3½ Beardmore-Precision)	L. A. Bees	350
25	Humphreys and Dawes (2⅞ O.K. Union)	P. Pike	292
26	D. Read and Co. (2⅞ The Ready)	D. Read	293
27	W. J. Lake (2¾ A.J.S.)	Entrant	349
28	New Imperial Cycle Co. (2⅞ New Imperial)	L. Horton	294.4
29	New Imperial Cycle Co. (2⅞ New Imperial)	L. Tonks	292.4
30	F. E. Baker, Ltd. (3½ Beardmore-Precision)	A. G. Cocks	350
31	F. E. Baker, Ltd. (3½ Beardmore-Precision)	H. Greaves	350

CLASS C.—SOLO MACHINES UNDER 500 C.C.

32	Sopwith Aviation Co., Ltd. (3 A.B.C.)	K. Robinson	400
33	P. H. Hall (4 Blackburne)	Entrant	499
34	H. W. Merrill, jun. (3 A.B.C.)	Entrant	400
35	Norman Rycroft (4 Triumph)	Entrant	550
36	John Marston, Ltd. (3½ Sunbeam)	G. Dance	499
37	John Marston, Ltd. (3½ Sunbeam)	F. C. Townshend	499
38	H. Church (3½ Sunbeam)	Entrant	499
39	Capt. R. M. Knowles (3½ Norton)	Entrant	490
40	A. S. Guthrie (3½ Sunbeam)	Entrant	499
41	Alex. Wilkes (3½ Rover)	Entrant	499
42	N.U.T. Motor Co., Ltd. (3½ N.U.T.)	F. J. Fieldhouse	499
43	R. C. Winn (3 A.B.C.)	Entrant	398
44	E. A. Edwards (3½ N.U.T.)	Entrant	499
45	N.U.T. Motor Co., Ltd. (3½ N.U.T.)	W. C. Thompson	499
46	John Marston, Ltd. (3½ Sunbeam)	T. C. de la Hay	499
47	N.U.T. Motor Co., Ltd. (3½ N.U.T.)	D. Robb	499
48	Mrs. O. M. Knowles (3½ Norton)	Entrant	490
49	D. L. Greig (3½ Sunbeam)	Entrant	499
50	New Rover Cycle Co., Ltd. (3½ Rover)	G. Featherstonhaugh	499
51	B.S.A. Co., Ltd. (3½ B.S.A.)	H. F. Edwards	499
52	James Cycle Co., Ltd. (3½ James)	G. A. Strange	495.5
53	W. G. Harrison (3½ Sunbeam)	Entrant	499
54	Phelon and Moore, Ltd. (3½ P. and M.)	H. M. Batten	498
55	F. A. Longman (3½ Ariel)	Entrant	498
56	Phelon and Moore, Ltd. (3½ P. and M.)	G. M. Townsend	498
57	Capt. R. Locke (3½ Coventry Eagle)	Entrant	499
58	M. Davies (3½ Sunbeam)	Entrant	499
59	Phelon and Moore, Ltd. (3½ P. and M.)	J. J. A. Dias	498
60	Dunford and Elliott (Sheffield) (4½ Dunelt)	Dudley Barton	499

CLASS D.—SOLO MACHINES UNDER 750 C.C.

61	G. L. White (5 Rover)	Entrant	654
62	Harley-Davidson Motor Co. (4 Harley-D.)	D. H. Davidson	584.02
63	Scott Motor Cycle Co., Ltd. (3⅜ Scott)	Capt. C. P. Wood	532.5
64	New Rover Cycle Co., Ltd. (5 Rover)	W. Brandish	654
65	Harley-Davidson Motor Co. (4 Harley-D.)	J. A. O. Sullivan	584.02
66	B. Alan Hill (3⅜ Scott)	Entrant	532.5
67	E. S. Astley (5 Rover)	Entrant	650
68	New Rover Cycle Co., Ltd. (5 Rover)	D. H. Noble	654

140	F G Boddington (10 Morgan)	Entrant	1100

"One Design" Classes at Brooklands.

The B.M.C.R.C. First Open Meeting.

THE race meeting which took place at Brooklands on Saturday last was the first of a new series. Formerly the Brooklands Automobile Racing Club always included at least two motor cycle races at its meetings, and since this practice has been discontinued there have been no car and motor cycle races held during one afternoon. On Saturday, however, several motor car races figured in the programme, which was organised by the Essex Motor Club, a really live body which kept its events right up to schedule and provided excellent sport.

From the spectator's point of view the racing was not so interesting to watch as at the last B.M.C.R.C. meeting, owing to the events not starting and finishing at the fork. When this method of procedure is followed the competing vehicles pass close to the spectators at the end of every lap, and their progress throughout the race may be easily followed.

Various Starting Points.

On this occasion the starts took place sometimes at the fork, in the finishing straight or in the railway straight; the lap progress was impossible to follow, as the motor cycle competitors' numbers viewed from the finishing line were not discernible, even through powerful glasses.

Very little more could be seen even from the stewards' tower where we were allowed to stand, through the courtesy of Col. Lloyd and Mr. Loughborough, and had it not been for the kindness of Mr. T. D. Dutton, the circuit counter, it would have been impossible to have given a coherent account of each event.

Owing to the inadequacy of the temporary barrier placed across the top of the finishing straight car races cannot at present be started and finished at the fork, as the said barrier would not stop a wheel which might become detached from a competing car from running amok among the spectators. If this is so it would have been better to have started all the motor cycle events at the fork, and to have run them off separately at the beginning of the meeting, and to have organised the car races during the latter part of the afternoon.

The Junior Race.

The weather was gloriously fine, and there was a very fair attendance. The first event was the Junior Open Motor Cycle Handicap (about eight miles), for solo motor cycles not exceeding 500 c.c. The start was in the paddock and the machines had to pass the fork twice, then enter the straight and finish at the long finishing line. The event was very well supported, and of the machines which were present at the start, the most interesting and novel was S. L. Bailey's Douglas, which he has entered for the Grand Prix race at Le Mans on August 28th. It was in full touring trim, and had a ribbed aluminium casing containing oil to lubricate the overhead valve rockers, and a front rim brake. Emerson had a 460 c.c. French built A.B.C. for this event, but it did not compete.

The start was devoid of incident, and the first lap order at the fork was: Bennett, Longman, McNab, Hemy, Hull, Watson, Weatherall, Jacobs, Longden, Eve, Thorpe, Thompson, Bailey, and Miller. The second lap order was: Watson, Hull, Longman, McNab, Miller, Bennett, Eve, Thorpe, Thompson, and Jacobs. The result was a triumph for Douglas machines.

		C.C.	Start. m.	s.
1.	*H. Thorpe (Douglas)	350	1	3
2.	A. Watson (Douglas)	350	2	42
3.	T. Thompson (Douglas)	350	1	45
	T. Eve (Matchless)	330	1	30
	A. G. Miller (Matchless)	496		42
	J. F. Hull (Wooler)	346	2	48
	F. A. McNab (Wooler)	346	3	3
	S. L. Bailey (Douglas)	500		—
Closely followed by:				
	J. L. Emerson (A.B.C.)	400	Scr.	
	P. G. Dallison (Norton)	490		42
	W. A. Jacobs (Singer)	240	2	15
	S. E. Longman (Wooler)	346	3	9

*Winner's time, 9m. 42⅘s.=63¼ m.p.h.

In the Essex Short Handicap (about five and threequarter miles) which followed only two vehicles with which this journal deals took part, and of these Major Empson's A.V. retired, and Lieut. W. R. Steeles, G.N., came in fourth. Event 3 was a motor bicycle race—the Senior Open Motor Cycle Handicap (about eight and a half miles), for machines with engines not exceeding 1,000 c.c. The start was at the fork, which was passed twice before the straight was entered. There were twelve entries, all of which, save one, started. The first time past the fork, the competitors came by in the following order: Gayford, Davidson, Bond, Le Vack, Baldwin, Sawer, Harveyson, Remington, while the second lap order was: Gayford, Le Vack, Baldwin, Davidson, Bond, Harveyson, Sawer, and Remington. Rolfe (J.A.P.) retired in the second lap, as his front cylinder refused to fire. A brilliant win was made by Le Vack, who made his first appearance as an Indian rider at this meeting. Earlier he had been mounted on Godfrey's old single cylinder racer, his machine caught fire after passing the finishing line, but was promptly put out by the red-coated Pyrene men, but not before the rider had sustained a burn in the leg. Result:

		C.C.	Start. m.	s.
1.	*H. Le Vack (Indian)	994		15
2.	O. M. Baldwin (Matchless-Jap)	986		15
3.	V. Gayford (Zenith-Jap)	744	1	12
	G. L. Sawer (American X)	1,000		27
	H. R. Harveyson (Indian)	998	Scr.	
	E. Remington (Nut-Jap)	986	Scr.	
	D. H. Davidson (Harley-Davidson)	584	1	12
	R. Bond (Zenith-Jap)	976	1	0

*Winner's time, 7m. 14⅘s.=80 m.p.h.

In the Light Car Essex Long Handicap (about eight and half miles), W. D. Hawkes's Morgan came in third. He had 45s. start.

The chief novelty of the meeting was the introduction of the two "one design" races, of which the first was the Zenith Open Scratch Race (about four and threequarter miles). First prize, silver cup, value ten guineas, presented by Messrs. Zenith Motors, Ltd. Second prize, Zenith gold medal and £3. Third prize, Zenith gold medal and £1. The start was at the railway straight, and the machines, after passing the fork once, entered the straight. Unfortunately, it is not quite accurate to name this a one design race. The Zeniths had to have side-by-side valve engines not exceeding 85 mm. bore. This resulted in a variation of engine sizes, and several different makes of carburetters were fitted. Consequently close finishes were hardly to be expected. The event was well supported. Bond took the lead past the fork, and was followed by Salter, Gayford, Don (riding Dequin's machine), Harwood, Newbold, Harveyson, Jacks, Baragwanath, Cushman, Pinder, Mcnab, and Spikens. Result:

1.	*K[illegible]e Don (Zenith)	986 c.c.
2.	R. Bond (Zenith)	970 c.c.
3.	V. Gayford (Zenith)	750 c.c.
	F. E. Salter (Zenith)	986 c.c.
	J. E. G. Harwood (Zenith)	986 c.c.
	H. R. Harveyson (Zenith)	986 c.c.
	F. A. McNab (Zenith)	986 c.c.
	E. C. E. Baragwanath (Zenith)	986 c.c.
	W. J. Kelly (Zenith)	986 c.c.
	L. A. Cushman (Zenith)	986 c.c.
	M. Jacks (Zenith)	—
	F. R. G. Spikens (Zenith)	986 c.c.

*Winner's time, 4m. 30⅘s.=64½ m.p.h.

The Douglas Open Scratch Race for Douglases with side-by-side valve engines was not at all well supported, as there were only nine entries and five starters. The starting place, distance, and method of running were the same as for the Zenith race. First prize, silver cup, value ten guineas, presented by Messrs. Douglas Motors, Ltd. Second prize, £5. Third prize, £3. As they passed the fork, V. Longden was leading, followed by Watson and Thompson, who led at the start; Amery and Lloyd brought up the rear. Result:

1.	*T. H. Amery (2¾ Douglas)	350 c.c.
2.	A. Watson (2¾ Douglas)	350 c.c.
3.	V. Longden (2¾ Douglas)	350 c.c.
	R. T. Lloyd (2¾ Douglas)	350 c.c.

*Winner's time, 5m. 26⅘s.=53.55 m.p.h.

The finish was a close one.

The last event was the Open Three-wheeler Handicap (about eight and a half miles). For three-wheeled cars and motor cycles with sidecars. The machines started at the fork, which they passed twice, and then entered the straight.

Handicap for Three-wheelers.

This was an excellent race. F. A. Longman, the limit man, was leading at the first round, followed by Dickenson, Crossthwaite, and De Lissa, who was travelling well, Dequin, S. E. Longman, Bond, Chater Lea, Davidson, Openshaw, Sawer, Harveyson, Jepson, and Hawkes. The next time the competitors appeared De Lissa was leading, followed by S. E. Longman, Crossthwaite, Bond, Dequin, Dickenson, Chater-Lea, Sawer, Davidson, Openshaw, F. A. Longman, Jepson, Harveyson, and Hawkes. De Lissa increased his lead at the finish and won easily. Result:

		C.C.	Start. m.	s.
1.	*O. de Lissa (Motosacoche)	990	2	6
2.	R. Bond (Zenith-Jap)	976	2	6
3.	S. E. Longman (Harley-Davidson)	990	2	6
	G. L. Sawer (American X)	1,000	1	6
	R. Dequin (Zenith-Jap)	744	2	21
	C. Crossthwaite (James)	—	—	
	W. D. Hawkes (Morgan)	1,098	Scr.	
	H. Jepson (Zenith-Jap)	986		48
	H. R. Harveyson (Indian)	994	1	6
	D. H. Davidson (Harley-Davidson)	584	2	6
	L. P. Openshaw (Zenith-Jap)	986	1	6
	P. R. Dickenson (Triumph)	499	3	15
	J. Chater-Lea (Chater-Lea)	999	1	54

*Winner's time, 10m. 33s.=56.81 m.p.h.

Open Hill-climb in South Wales.

High speeds over a Long Course.

ONCE again Sunbeam and Norton riders have shown their prowess when, on the occasion of the Welsh Eastern Group M.C.C.'s open hill-climb on Govelin Hill, last Saturday, they vied with each other for premier awards.

The course was two and threequarter miles in length, with an average gradient of 1 in 9. Starting on the bridge, competitors had about a hundred yards of level to get into their stride, then swinging sharply to the left a straight steep stretch brought them to the famous Fiddler's Elbow. This was, of course, the main point of vantage from a spectacular point of view, and a good crowd had assembled to watch the various methods of cornering.

After taking the Elbow a stiff, almost straight mile is followed by a series of snake-like bends until the summit is reached, where a short "blind" of flat allowed high speeds over the finishing line.

The weather was ideal throughout the afternoon, and the road surface hard and for the most part very good. Marshals were posted at entervals *en route*, especially near the top, where some slight trouble was experienced by mountain sheep straying on the road. The organisation was excellent, though with such a long course the necessary intervals between performances proved rather tiring to some of the on-lookers.

Good Scooter Climb.

Punctually at two o'clock the first man, S. R. W. Lincup (1¾ Whippet scooter), was sent off. He climbed well, but was easily beaten by his only rival, W. G. C. Hayward, who was similarly mounted. The latter made the climb in 7m. 30⅘s.—faster than one of the lightweights.

Six riders competed in the 350 c.c. members' class, which proved an easy win for Reg. Brown, who made a very fine ascent on a 2¼ Diamond in 4m. 34⅘s. T. J. Parfitt (2¾ Douglas) came up well, but missed his gear change after the Elbow, and stopped. He however, made a very good get away on the steep incline. N. Mitchell (2¾ Verus) was slow, though he improved his time considerably in the open class which followed. Here George Dance made his appearance with his 2¾ Sunbeam. He came up very fast; his time, however, was some 16s. slower than that of Reg. Brown. The spectators were keenly interested in the proceedings, and many who were perched high on the hill, in order to get a longer view, called out for results as we trudged up the seemingly endless slope to view the riders from a different point.

Fast Climbing and Cornering.

The larger classes brought out several very fast machines and proved a tussle for best times between G. Dance (3½ Sunbeam), Reg. Brown (3½ Sunbeam), C. Sgonina (3½ Norton), and R. E. Toms (3 A.B.C.). Some very fast riding and beautiful corner work was witnessed, one of the most noticeable features being the extraordinary acceleration of these machines on the stiff rise after taking the Elbow. R. E. Toms (A.B.C.) hugged the inside well, his little engine screaming up while his *confrère*, A. White, struck the bank, stopped, and was later baulked by sheep near the top. Reg. Brown and G. Dance both made very fast ascents, and in spite of the latter losing his float chamber cover he covered the distance in 3m. 39⅕s., a speed of over 45 m.p.h. S. C. Chivers was handicapped with a single gear on his Norton, but made a good climb as did R. Jenks and A. Thom, both riding Harley-Davidson sports machines.

The second fastest man was C. Sgonina who was riding a 3½ Norton, fitted with a special overhead valve cylinder. He seemed quite a favourite with the crowd, but was 5s. slower than Dance's time. E. H. Ivens (4 Norton) skidded right round on the Elbow, while R. W. Hill (4-5 Veriot-Precision) came round with his petrol pipe adrift, his fuel spurting all over the engine.

It was unfortunate that a breakdown in the telephonic timing arrangements marred an otherwise excellent afternoon's sport. The results were as follow:

CLASS 1.—Scooters (Open).
1. W. G. C. Hayward (1¾ Whippet).
2. S. R. W. Lincup (1¾ Whippet).
Winner's time 7m. 39⅘s.

CLASS 4.—350 c.c. Solo (Members).
1. Reg. Brown (2¼ Diamond).
2. F. T. Stephens (2¾ Douglas).
3. F. E. Jenkinson (2¾ Wilkin).
Winner's time 4m. 34⅘s.

CLASS 5.—350 c.c. Solo (Open).
1. G. Dance (2¾ Sunbeam).
2. N. Mitchell (2¾ Verus).
3. F. E. Jenkinson (2¾ Wilkin).
Winner's time 4m. 50⅘s.

CLASS 6.—500 c.c. Solo (Members).
1. Reg. Brown (3½ Sunbeam).
2. R. E. Toms (3 A.B.C.).
3. C. Sgonina (3½ Norton).
Winner's time 3m. 55⅘s.

CLASS 7.—500 c.c. Solo (Open).
1. G. Dance (3½ Sunbeam).
2. C. Sgonina (3½ Norton).
3. Reg. Brown (3½ Sunbeam).
Winner's time 3m. 39⅕s.

CLASS 8.—750 c.c. Solo (Members).
1. C. Sgonina (3½ Norton).
2. Reg. Brown (3½ Sunbeam).
3. S. C. Chivers (3½ Norton).
Winner's time 3m. 44⅘s.

CLASS 9.—750 c.c. Solo (Open).
G. Dance (3½ Sunbeam), 3m. 41⅘s.

The fastest time was made by G. Dance (3½ Sunbeam) in 3m. 39⅕s. (45.16 m.p.h.).

S. C. Chivers, who rode a 3½ single-geared Norton. He made the ascent of 2¾ miles in 4m. 25⅕s.

A SPORTING TRIAL IN YORKSHIRE.

The Scott trial, which will take place on September 4th, is an annual event in which the organisers (the Scott Motor Cycle Co., Ltd.) endeavour to select the most arduous course that can be found on the West Yorkshire moors.

A map of the 1920 course is now before us, and from an intimate knowledge of the district, we can vouch for the "colonial" nature of the obstacles to be encountered. There are four observed water-splashes and five observed hills, and the scenery on all parts of the route is exceptionally fine.

The event is open to anyone, irrespective of make of machine; there are no entry fees, and competitors will find that all arrangements for meals, marshalling and arrowing are carried out most efficiently. Several valuable awards are offered, including trade and amateur team prizes, best solo prize and club team prize. Entries close on Saturday, and intending competitors should write at once to Sales Department, the Scott Motor Cycle Co., Ltd., Saltaire, Shipley, Yorkshire.

AN AMBITIOUS MINIATURE.

The Unibus, embodying many Features which follow Car Practice.

ALTHOUGH from its appearance the Unibus is sure to be called a motor scooter, yet when one comes to consider the design of this machine, it seems to warrant a more dignified title, for it is a veritable miniature car on two wheels. The little machine can best be described by considering it as a chassis with the bodywork (including the ample mud shields which completely protect the rider) removed. It is then seen to consist of a frame composed of steel side members with pressed steel ends. To the front end the steering head is fixed, and to the rear the back wheel is attached through the medium of leaf springs and radius rods.

The suspension deserves particular attention, as quarter elliptic springs are used both front and rear, the front springs being anchored to a plate at the base of the steering column, and their free ends attached to small links which hold the spindle of the front wheel, and which are also held by radius rods, themselves connected together so that lateral rigidity is secured. At the rear the quarter elliptic springs are anchored to the steel frame in a horizontal position, and over the springs radius rods are arranged, again rigidly connected together. A substantial link on each side connects the free end of one spring to the radius rod above it, and also accommodates the spindle of the rear wheel, so that here again lateral rigidity is assured, and the back wheel has its motion restrained to an approximately vertical path.

AN OPEN-FRAMED MACHINE WITH SHAFT-DRIVE.

Designed to provide every protection for the driver, the Unibus is the nearest approach to a miniature single track car that has yet been produced.

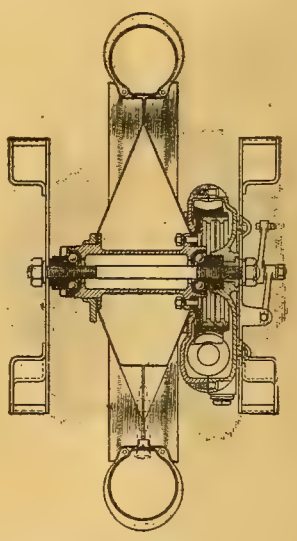
This view shows the position of the starting handle, gear change, and tank.

At the front of the frame the two-stroke engine is mounted, together with four pillars which support the petrol and oil tank and the top of the steering head. This engine has a bore and stroke of 70 × 70 mm., giving a capacity of 269 c.c. It is of the three-port type, and is equipped with magneto ignition. The engine is set across the frame in a vertical position, and attached to the engine-shaft is a Ferodo-lined dry plate clutch of ample size. From this the drive is transmitted to a two-speed gear box which has the gears always in mesh, engagement being by means of dog clutches. The drive is indirect on both gears, and from the gear box is taken by a shaft to an underslung worm drive attached to the rear wheel. Universal and sliding joints are arranged at each end of the propeller-shaft, and the underslung worm is of steel, while the worm wheel is of phosphor bronze.

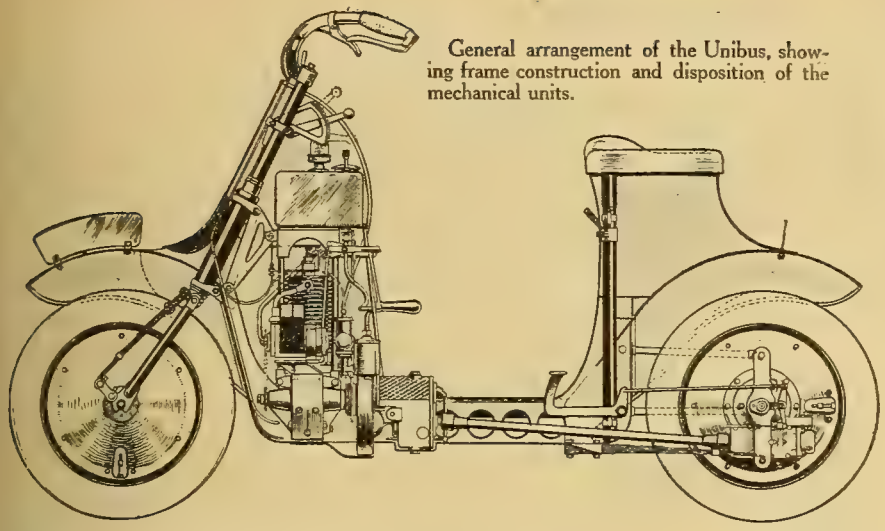
Thus, it will be seen that the transmission is entirely on car lines, and the same remark applies to the brakes. The phosphor bronze worm wheel is arranged to form a drum, in which are situated, side by side, two pairs of expanding cast iron brake shoes, one pair being operated by Bowden control from the handle-bar and the other pair by a pedal conveniently situated near the driver's heel.

Before leaving the "chassis" the wheels themselves are worthy of description, since they are formed of two dished steel stampings, held rigidly on a hub by a special device, and clamped together at their edge by small thumbscrews. The edge of each disc is formed as one half of the rim, to hold the 16 × 2¼in. wired-on Dunlop

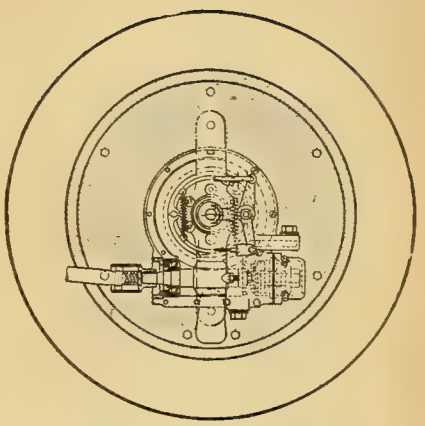
The front mudguard and engine shield are built to form one piece; the rear guard, too, being constructed in a similar manner, giving ample protection to the rider.



The underslung worm drive in part section, and rear hub brakes.



General arrangement of the Unibus, showing frame construction and disposition of the mechanical units.



Section through centre of rear wheel, showing side-by-side internal expanding brakes.

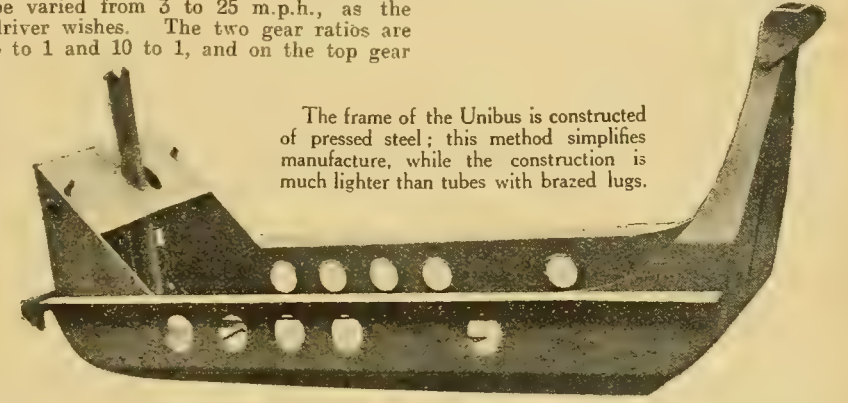
tyres. Should it become necessary to remove the tyres, the wheel is easily detached from the machine, and then is as easily taken apart in order that the tyre may be removed. A stand on motor cycle lines is arranged in front of the rear wheel, and is automatic in action, since a leaf spring bears on a cam formed on the spindle of the stand. The tank accommodates both petrol and oil, and a sight feed drip lubricator supplies oil to the cylinder and crank case of the engine.

Not only is the rider protected from mud and water thrown up on wet roads by the very complete mudguarding, but the engine is completely boxed in also, so that the rider's clothes are in no danger of becoming soiled with oil.

The seat is formed of a steel pressing, suitably padded, supported on a pillar, which forms a portion of the rear of the frame. Over the rear mudguard or shield a compartment is formed which accommodates a dry battery for supplying current to the electric lamps, a pump and a tool kit, and also leaves sufficient room for carrying a number of small parcels. This compartment is closed by the seat, which can be swung forward out of the way when access to the compartment is required. Suitable apertures are left in the front portion of the "body" to allow for cooling, and we are informed that no danger from overheating need be feared.

Protection for the Rider.

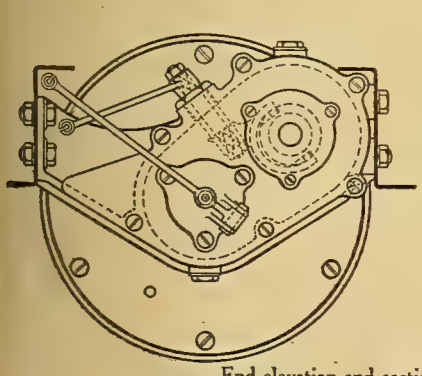
One of the chief attractions of the machine is that it is possible to use it in any weather, and in any clothes, without danger of becoming soiled or splashed, and, in addition to this, the ease of control of the little vehicle is a great asset. A handle starter is arranged by means of a chain and sprockets embodying a ratchet. On the road the speed may be varied from 3 to 25 m.p.h., as the driver wishes. The two gear ratios are 6 to 1 and 10 to 1, and on the top gear of 6 to 1 we are informed that Cleeve Hill and Leckhampton Hill, near Cheltenham, are climbed with ease.

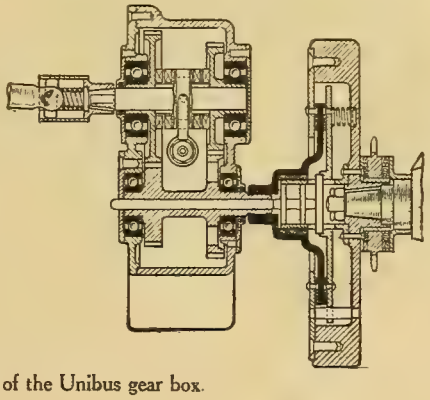


The frame of the Unibus is constructed of pressed steel; this method simplifies manufacture, while the construction is much lighter than tubes with brazed lugs.

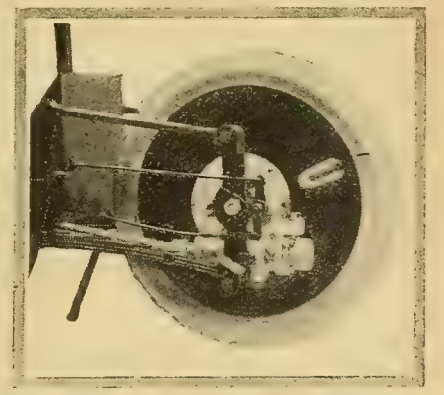
Manufactured in the fine modern workshops of the Gloucestershire Aircraft Co., at Sunningend Works, Cheltenham, the machine will be handled by the Service Motor Co., Ltd., Circus House, Oxford Circus, W.1, and its price, we understand, will be ninety-five guineas. This, of course, is a high figure, but one must understand that the design of the Unibus is on car lines, and is excellently carried out in practice. It is designed not as a motor scooter but as a small utility mount for ladies or gentlemen.

Such a machine as the Unibus should prove an interesting experiment, for when it has been on the market for a reasonable time it will be possible to judge whether the buying public prefer to pay approximately £100 for a luxurious and well-made miniature of this type or a motor cycle following conventional lines, with possibly fewer refinements, but capable of higher speeds and a wider sphere of action.





End elevation and section of the Unibus gear box.



Exterior of rear wheel showing springing arrangement. Observe the radius rod.

CLUB NEWS (Continued from p. 223.)

Market Harborough M.C.C.

A motor cycle club is being formed at Market Harborough, and motor cyclists residing in that district who are interested should communicate with Mr. A. M. Dawbarn, 96, St. Mary's Road, Market Harborough.

Lancaster, Morecambe, and District M.C.C.

It is proposed to hold a flying kilometre speed trial on Morecambe Promenade on September 22nd. As this will be a closed event, only members are eligible to compete. The hon. sec., Mr R. L. Ducksbury, will furnish particulars regarding visiting membership to anyone interested. Enquiries should be sent to him at Elms Hotel, Bare.

Hill-climb at Brighton.

With a view to forming a much-needed motor cycle club for Brighton and district a successful hill-climb was held on Sunday, 8th inst., the venue being Saddlescombe Hill. The unlimited solo class had to be run off twice, Dobson (3½ A.B.C.) and Hampton (8 Zenith) "dead-heating" twice. Dobson had an unfortunate accident, but was eventually proclaimed the winner after Hampton had run for a third time, he failing to beat Dobson's best time.

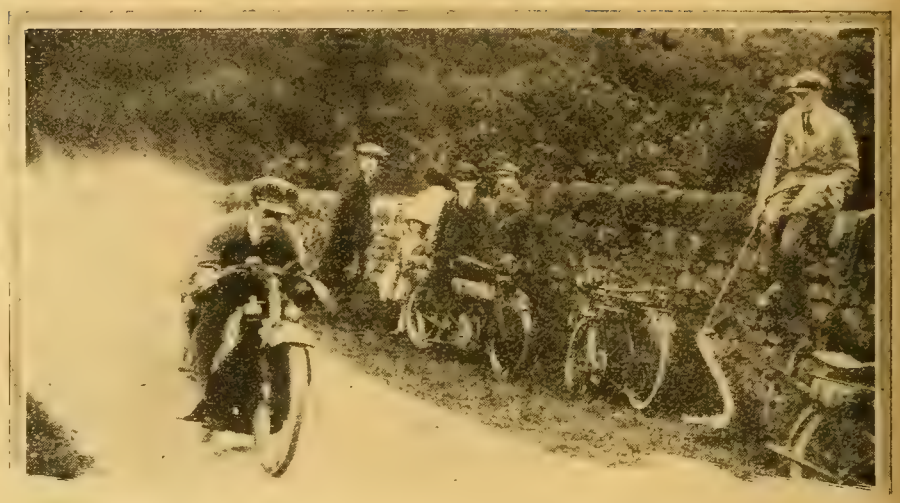
The organisers would be glad if intending members would forward their names and addresses to Mr. C. Watts, secretary (*pro tem*), 24, York Villas, Brighton. It is hoped, if the membership warrants it, to get the famous Madeira Drive for a speed contest in the near future. Results :

CLASS 1 (up to 350 c.c. Solo).—C. Volk (2¾ Douglas), 28⅘s.; H. W. Moreton (2¾ Douglas), 23⅘s.

CLASS 2 (up to 600 c.c. Solo).—H. D. Dobson (3½ A.B.C.), 22s.; H. Dyer (4 Triumph), 26⅘s.

CLASS 3 (Unlimited, solo).—H. D. Dobson (3½ A.B.C.), 22⅘s.; H. A. Hampton (8 Zenith), 23⅘s. (After run off.)

CLASS 4 (Unlimited, passenger).—W. Teeson (6 Enfield), 37⅘s.; —. Trill, 7-9 Indian), 38⅘s.



A flying start. G. Hill (Scott) in the Harrogate and District M.C.C. hill-climb last Saturday.

Northern M.C.

Recently this Northern club held a most successful reliability trial. The course, which covered Newcastle, Berwick, and Rothbury, with a total mileage of about 135 miles, was rather an easy one, and no great effort was required to keep to time. The attendance was quite good, and most of the competitors did well, about ten of the club's gold medals being won. There were two observed hills, these being well-known in the North, *i.e.*, Lakeside and Corbie Hills. Three competitors failed on the former.

The next big event of this club will be the two days' reliability trial to Scarborough, when it is expected that there will be a good entry. This trial, which will decide the winner of the Rudge-Whitworth Cup, will not be an easy one, many well-known hills in the Whitby and Cleveland districts being included.

Hull M.C.C.

A hill-climb was held on Saturday last at Garrowby Hill, the York Club ably officiating. The fastest time of the day was made by L. Runton (3 A.B.C.), and in the lightweight class Mr. W. V. Worthington (2¾ Wooler) was fastest. Mr. N. Walker (4 Triumph) won second places in Classes 3 and 4. Next Saturday Major A. J. Atkinson is entertaining the members of both local clubs to a gymkhana and hill-climb at his residence, Elloughton Dale. Events start at 3.30 prompt, and all Saturday. A good number of members turned out and everything was run off without a hitch, some quite good performances being put up in the various classes. The results on formula were as follow :

Harrogate and District M.C.C.

For the first time this year the Harrogate Club managed to have a fine day for a competition, and a nice little event in the form of a hill-climb was run off on Saturday, August 14th, with the following on formula results :

CLASS 1.—Solos up to 275 c.c.

1. J. Naylor (2¼ New Hudson).
2. W. E. Grange (2¼ Autoglider).
3. Mrs. T. Baxter (2¼ Triumph).

Winner's time 43s.

CLASS 2.—Solos up to 350 c.c.

1. M. Parkinson (2¾ Douglas).
2. T. Leak (2¾ Douglas).
3. E. R. Davies (2¼ Triumph).

Winner's time 38⅘s.

CLASS 3.—Solos up to 560 c.c.

1. H. E. Ellis (4¼ B.S.A.).
2. G. A. Nunneley (3½ Norton).
3. G. Hill (3¾ Scott).

Winner's time 34⅘s.

Fastest time in class, A. Hill (4 Triumph), 34⅘s.

CLASS 4.—Solos (Unlimited).

1. M. Parkinson (2¾ Douglas).
2. W. Backhouse (4 Triumph).
3. H. E. Ellis (4¼ B.S.A.).

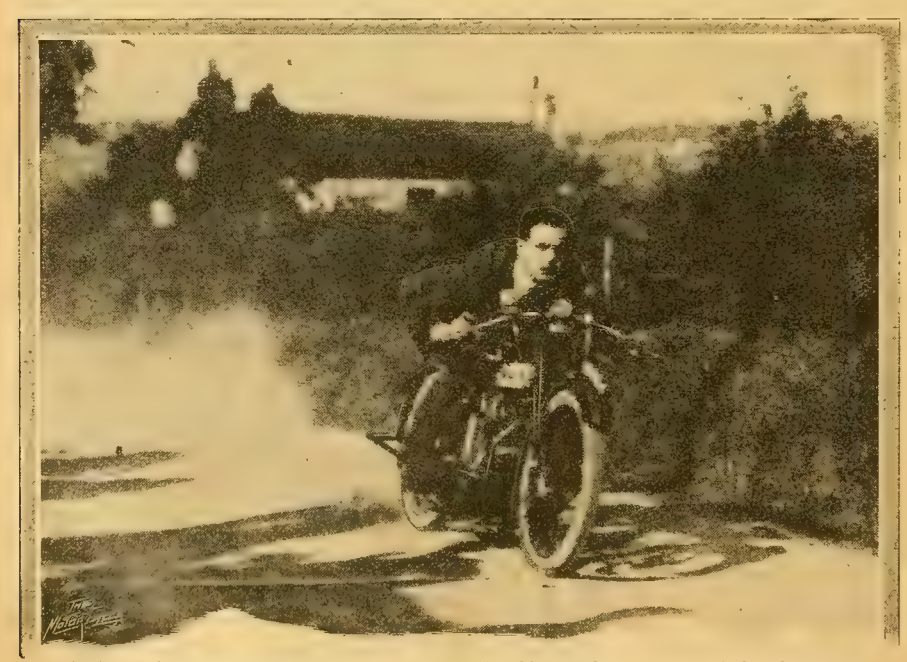
Winner's time 43s.

Fastest time on class and fastest time of the day to Backhouse (4 Triumph), 32⅘s.

CLASS 5.—Passenger Machines.

1. A. Hill (4 Triumph sc.).
2. T. W. Monkhouse (4 Triumph sc.).
3. J. Baxter (4 Triumph sc.).

Winner's time 46⅘s.



A. Alexander making fastest time of the day in the Glasgow Western M.C.C. last Saturday on a 3½ Douglas.

QUESTIONS AND REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not **must be accompanied by a 2d. stamped addressed envelope for reply.** Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

A Lightweight Consumption.

[?] I ride a 1919 2¼ h.p. Levis, and the petrol consumption lately has been excessive. It is only doing about 45 m.p.g. Can you tell me how to remedy this? The bicycle is fitted with an Amac carburetter with a 24 jet. There is no belt slip, but the engine gets overheated after running a few miles. As far as I can tell, the petrol level is correct.—A.R.H.B.

The details you give are quite insufficient to enable us to suggest the cause of the trouble. It is possible that the carburetter is flooding, or may be the ignition timing has slipped, thus causing a late spark, which is especially detrimental to good results in a two-stroke engine. The cylinder may also require decarbonising, especially in the region of the exhaust port.

Building a Machine.

[?] (1.) Having recently purchased a 4 h.p. 50° twin J.A.P. engine, bore and stroke of which I understand to be 60 × 76 mm., I intend fitting this up with a two-speed Albion gear box, but being unacquainted with the merits of this particular type of engine, so far as revolutions are concerned, I am in doubt as to what gear ratios to employ. (2.) What size of sprockets and pulleys do you recommend on the gear box, engine-shaft, and back wheel? (3.) What make of carburetter would you advise for flexibility? (4.) Is there any particular type of magneto most suited for this engine? (5.) I am fitting 26in. × 2¼in. wheels to this machine. Do you consider this quite heavy enough?—A.A.B.

(1 and 2.) You will not be able to obtain any variation from standard in the size of the sprocket and pulley fitted to the gear box which you intend purchasing, and the belt rim also you will probably have to obtain in a standard size, such as 18in. or 19in. The only variation you will be able to make will be in the size of the crankshaft sprocket, which you will have to have specially made. We would suggest that a gear in the neighbourhood of 6 to 1 would be most suitable for this engine. The rule for finding gear ratio is to multiply the diameters or number of teeth of all the driving wheels, and also to multiply the similar dimensions of the driven wheels. Divide the latter product by the former to obtain the ratio. (3.) Almost any well-known make of carburetter would suit this engine if you obtain one of the correct size. It would be advisable to consult the makers of the engine, however, as they will be able to inform you of the particular carburetter which they have found to be most satisfactory. (4.) You will, of course, require a 50° magneto, but we cannot tell you the direction of rotation, as this depends on the driving arrangements provided for on the engine. (5.) 26in. × 2¼in. wheels will be quite in order, but it would be advisable to fit 2⅜in. covers on them.

Defective Drip Feed.

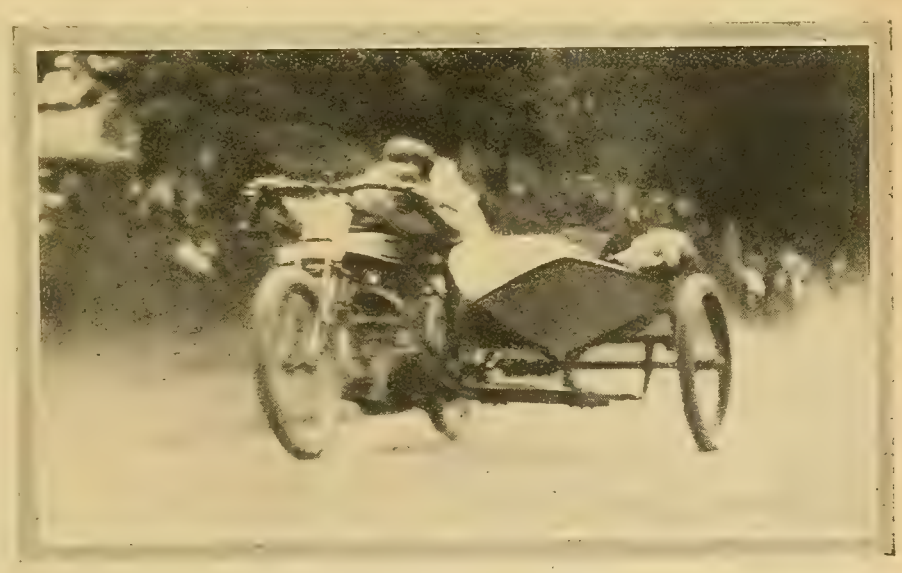
[?] I have trouble with the drip feed of my B.S.A. The oil flows down quite freely when engine is stopped, but once the machine is going the oil stays in the glass. I have often cleaned the little pen steel disc, etc., but with no improvement. Can you say why it does not work? I have to stop every four miles to let the oil go down.—B.W.

Possibly the trouble is due to the small ball valve between the oil pump and the drip feed sight body. You will be able to dismantle and clean this on removing the small set screw which you will find beside the gland nut at the top of the pump. If this is clear, and if the pen steel non-return valve is also working, the oil pump should work correctly provided the crankshaft air-release is clear.

Chain Adjustments.

[?] (1.) There is a little wrong with the gears of my 3½ h.p. Sunbeam, and I wish to take down the gear box. Please give details how to take this down, regarding clutch plates and sprocket. (2.) If repair is necessary on examination, would it be advisable to send the box to the makers? (3.) Back chain, I find on turning the wheel, is slack at one place; turning a little further it becomes tight. What is the necessary adjustment to effect a remedy?—H.H.

(1.) You should obtain the makers' instruction booklet, as this will give you all the details you require. Dismantling the gear box is a fairly simple operation, as it is quite obvious when you take the box off the frame what parts must be removed; you can scarcely go wrong in this. (2.) As you do not state the nature of the trouble we cannot advise you on this point. If any parts are defective, you would probably be able to replace them yourself. (3.) This trouble is usually experienced on all chain-drive machines. When adjusting the chains you should try them in various positions, and take care that the adjustment is correct when the chain is at its tightest point.



HIGH SPEEDS WITH A SIDECAR.

60 m.p.h. is glibly spoken of by many motor cyclists, but few ever accomplish that speed solo, much less with a sidecar. Here is G. W. Walker (Norton) travelling at over a mile a minute—a photograph obtained at the recent speed trials at Chatsworth Park.

An Uncontrolled Dog.

While riding a motor cycle along a highway, a dog, which was behind its master, suddenly bolted out at me right under the front wheel, and as a result I have been laid up three weeks with injuries to my knee. The machine itself is not much damaged. My friends advise me to sue the owner of the dog for damages. I shall be obliged for your reply to the following questions. I may mention that the machine is not insured for accident—nor am I. (1.) Do you think I have a good claim for damages? (2.) Should I interview the owner of the dog and thereby try to settle the matter with him; or (3.) Is it better to place the matter straight into the hands of my solicitor? (4.) I am told that I have a good claim, as all dogs are supposed to be under control on the highway. Is this correct? (5.) I can get witnesses who all say the dog deliberately charged out at me. Will this make the case stronger?—G.F.

(1.) No, unless you can show that the dog was to the owner's knowledge in the habit of rushing in front of motor cycles. (2.) Yes. (3.) This would be a waste of money, unless there is evidence to support the answer to No. 1. (4.) No, the law is quite clear that the owner of a dog is not liable for an act of a vicious or mischievous kind, unless it is known to the owner that the animal had that particular vice or mischievous propensity previously.

Raising the Gear.

Would you kindly give me your expert advice upon the following questions, as I contemplate purchasing an Army Triumph renovated by the makers? (1.) The number of teeth on the engine sprocket to give between 4½ and 4¾ to 1 on top, as I understand the standard ratio is 5 to 1, and consider this rather low for solo work. (2.) What 28 × 3in. tyres will fit the Triumph rims and clear the forks, and what effect will these tyres have with regard to gear ratio and speedometer readings? (3.) Could I fit a pair of 4 h.p. Douglas 1920 type front forks to a Triumph, and what effect would they have on the rake of the steering, etc.? At present I own a 2¾ h.p. Douglas and have also had a twin Zenith, and understand about keeping the revs. up by using my gears.—A.B.

(1.) You will find it very difficult to obtain a larger sprocket, although the makers may be able to supply one with seventeen teeth instead of the standard sixteen. (2.) You will probably find that Palmer cord tyres, size 28×3 will fit 26×2⅜ rims of the Triumph, but the makers do not guarantee them to do so. The 28in. tyre, of course, has the effect of raising the gear slightly, and it causes the speedometer to give a lower reading than the actual speed obtained. You can calculate the difference by working out the circumference of the two sizes of tyres and dividing these figures into one mile, thus finding out the number of revolutions the wheel will make in each case. (3.) It might be possible to fit a pair of 4 h.p. Douglas forks to the Triumph, but you would require special ball races to suit the Triumph head lug.

Excessive Oil Consumption.

I bought a 3½ h.p. J.A.P.-engined 1914 motor cycle six months ago. The engine pulls well when cold, and for about a mile. Then it overheats (especially the crank case) owing to shortage of oil. It consumes about one quart of oil every forty miles (B.B.), and even then does not get enough. I have just had it rebushed and new rings at a first-class works. The timing of the valves and ignition is correct. There is absolutely no oil leakage anywhere, and it is not being burnt in the combustion head, as the exhaust is practically colourless. The engine is mechanically perfect. Can you state any reason why this engine uses so much oil?—G.A.B.

The oil consumption of your engine is excessive, but without examination we are at a loss to give you any useful advice, as, from your description, the whole of the working parts are in good order. We can only suppose that one or more of the new bearings is too tightly fitted, and it will be advisable to remove the cylinder and make sure that all parts are moving freely.

IMPORTANT DATES.

Sa., Aug. 21st—
York and District M.C. Open Hill-climb at Sutton Bank.

Mon., Aug. 23rd, to Sat., Aug. 28th—
A.C.U. Six Days Trial. Darlington as a centre.

Sat., Sept. 4th—
Scottish Speed Championships at St. Andrews.
Scott Trial in Yorkshire.

Nov. 29th Dec. 4th—
Olympia Motor Cycle Show.

Speed and Consumption.

In an argument with a friend the other day on the subject of jets I advanced the opinion that, no matter what size the jet may be, the petrol consumption is always the same for a given speed. I do not profess to know much about carburetters, so for the sake of convenience I would take the Senspray as an example. Supposing, on a 3½ h.p. machine on top gear, I can do 50 m.p.h. on full throttle with a 38 jet; then with a 40 jet I can do more, say 55 m.p.h., on full throttle, therefore to get 50 m.p.h. with the 40 jet the throttle will not need to be open quite fully. Similarly, with a 42 jet, the throttle will not need to be open as much as it was with the 40 jet in order to get the 50 m.p.h., and so on, until the jet is of such a size that the mixture will be too rich if the throttle is open wide. The fact that the throttle will have to be opened less, the larger the jet, to get the 50 m.p.h. seems to point to my supposition that the amount of petrol used at a given speed is a constant. Am I correct?—F.C.S.

In a properly designed carburetter there is only one correct size of jet, and any other size will affect the running or petrol consumption, although to what extent depends entirely on the particular carburetter in use. Provided that the carburetter is correctly adjusted for the particular size of jet in use, it is presumable that the petrol consumption for a given distance at a given speed will be constant. In the instance you mention, we should imagine that, if you can attain the same speed with a smaller throttle opening by increasing the jet, the consumption will be raised owing to the higher velocity of the air stream over the jet orifice.

A Sidecarrier.

I require an attachment for a 7-9 h.p. Indian motor cycle to enable me to carry a light load daily over a practically level road. Would you kindly enlighten me on the following points? (1.) Which would be the more satisfactory: an ammunition carrier or a specially-built carrier? (2.) The dimensions of an ammunition carrier? (3.) The maximum load I could carry with a machine of this power?—J.B.G.

(1.) As you do not state the nature of the goods which you have to carry, we cannot give you much assistance in suggesting the type of body you should use. (2.) We regret that we have not got the dimensions. (3.) The maximum load you can carry depends upon the design of the sidecar chassis. Given a properly constructed and substantial attachment, you should be able to take a load of about 2 cwt.

EXPERIENCES WANTED.

"A.E.S." (Colne).—Grado gear.

RECOMMENDED ROUTES.

NEWPORT TO HASTINGLEIGH.—R.E.

Newport, Chepstow, Gloucester, Cirencester, Faringdon, Wantage, Didcot, Reading, Wokingham, Bracknell, Staines, Kingston, Sutton, Croydon, Westerham, Sevenoaks, Ashford, Hastingleigh.

LEIGHTON BUZZARD TO WESTON-SUPER-MARE.—H.G.R.

Leighton Buzzard, Wing, Aylesbury, Thame, Oxford, Kingston Bagpuze, Faringdon, Highworth, Cricklade, Minety, Malmesbury, Easton Grey, Acton Turville, Tormarton, Bristol, Bedminster Bridge, Congresbury, Worle, Weston-super-Mare.

GRIMSBY TO TORQUAY.—J.C.C.

Grimsby, Laceby, Caistor, Market Rasen, Lincoln, Newark, Leicester, Lutterworth, Rugby, Dunchurch, Southam, Gaydon, Kineton, Shipston-on-Stour, Broadway, Winchcombe, Cheltenham, Leckhampton, Painswick, Stroud, Nailsworth, Leighterton, Bath, Radstock, Shepton Mallet, Ilchester, Ilminster, Chard, Yarcombe, Honiton, Exeter, Exminster, Teignmouth, Torquay.

BIRMINGHAM TO HASTINGS.—A.A.H.

Birmingham, Stratford, Shipston, Enstone, Woodstock, Oxford, Littlemore, Dorchester, Benson, Nettlebed, Henley-on-Thames, Wargrave, Twyford, Hurst, Wokingham, Bracknell, Bagshot, past Bisley Camp, Warplesdon, Stoughton, Guildford, Shalford, Cranleigh, Horsham, Cowfold, Partridge Green, Steyning, Old Shoreham, New Shoreham, Brighton, Lewes, Wilmington, Revesby, Bexhill-on-Sea, St. Leonards, Hastings.

There's Music in it!

¶ THE DRONE OF THE ENGINE, RISING AND FALLING ACCORDING TO SPEED. THE HUM OF THE WHEELS ON THE OPEN ROAD IS MUSIC TO THE EAR OF THE MOTOR CYCLIST.

¶ THERE IS MUSIC AND HARMONY ALL THE WAY FOR THE OWNER OF A WELL-TUNED ENGINE.

¶ GODFREY'S BEING ENTHUSIASTIC MOTOR CYCLISTS, TAKE THE KEENEST INTEREST IN EVERY MACHINE THEY SEND OUT. THEY DO NOT SELL MOTOR CYCLES AS SO MUCH METAL, KNOWING LITTLE (AND CARING LESS) OF THEIR POTENTIALITIES. IT IS THEIR AIM TO SEE THAT EACH MACHINE HAS THE PROPER NOTE AND IS PERFECT IN EVERY DETAIL.

AT THE MOMENT we can give immediate delivery of:
A.B.C., BLACKBURNE, COVENTRY EAGLE, LEVIS, and SCOTT Motor Cycles.

We can also supply from stock new models of any of the following makes:
ALLON, ARIEL, CALTHORPE, CEDOS, CLYNO, DIAMOND, IMPERIAL, INVICTA, LEA FRANCIS, O.K. UNION, RUDGE MULTI, WOOLER.

EARLY DELIVERY OF—

The

Morgan Runabout

was the only Light Car or Cycle Car to win a

Gold Medal in the Scottish Six Days.

At

Brooklands, Aug. 2nd. All Three Races

for Light Cars and Cycle Cars was won by *MORGANS*, driven by Mr. W. D. Ware and Mr. W. D. Hawkes. Mr. Wares fastest time was *69½ M.P.H.* with a side-valved 977 c.c. J.A.P. engine in the 8½in. Light Car Long Handicap.

INTERNATIONAL SIX DAYS GRENOBLE GOLD MEDAL.

Morgan Motor Co., Ltd., Malvern Link.

This is a real Grip—the Grip you need.

MOST motor cyclists are now aware of the benefits to be derived from using the Pedley Pneumatic grips—the grips which have eliminated tired and aching wrists.

Naturally, the sale of Pedley Grips has increased enormously but we are again in the happy position of being able to give our usual prompt delivery. You should get in touch with us.

We have the largest selection of New and Second-hand Motor Cycles, Sidecars, and Accessories of every description.

If unable to call at our Showrooms to inspect our goods

SEND FOR BIG LIST!!

There is nothing that a Motorist requires which cannot be obtained from us, and at the **Lowest Market Price.** Now what about your Motor Cycle? Surely you can see it is positively cheaper, quicker, and more delightful than sticking in a train and travelling 50 or 100 miles, most probably in a cramped position. Ride a Motor Cycle, and get the fresh air and beautiful scenery, and—Dodge the Doctor.

We have in stock for immediate sale **100 New and Second-hand Motor Cycles and Sidecars,** ANY OF WHICH CAN BE PURCHASED UPON THE DEFERRED PAYMENT SYSTEM, PAYABLE IN THREE, SIX, OR TWELVE MONTHLY PAYMENTS.

We are **the Sole North London Agents** for the Cheapest and most reliable Lightweight on the market; immediate delivery. The **O.K.-JUNIOR,** with Villiers or Union engine, **48 gns.** Send for particulars. Also 2-speed models, **£65. Trade Supplied.**

1920 Scott and Scott Sidecar, Lucas lamps and horn, never been used; £193; handsome outfit.—Jesse Baker, Wigan. [2662

MOTOR CYCLES FOR SALE.

Scott.

SCOTT 3¾h.p., needs overhauling, water-cooled, believed 1913; first £20 secures.—Bryant, 36, East St., Colchester. [X8808

SCOTT Combination, 1920, perfect condition, acetylene lamps, horn and tools, tyres good; £165.—227, Maidstone Rd., Rochester. [2204

SCOTT.—Immediate delivery 1920 3¾h.p., 2 speeds, hand-controlled clutch model.—Parker's, Bradshawgate, Bolton. Tel.: 1348. [X8889

SCOTT (late 1914) Coachbuilt Combination, speedometer, Cameo, perfect condition; £75.—F., 31, Onslow Rd., Richmond, Surrey. [2935

3¾h.p. Scott, early, excellent condition, ridden daily; £37; exchange S.S.S. lathe and tools.—Osborne, 202, Foley Park, Kidderminster. [9513

1920 Scott, mileage about 700, lamps and accessories, fully insured; £128 for quick sale.—Owen, 73, Harrogate St., Barrow-in-Furness. [2131

SCOTT Combination, late 1919, little used, good condition, fully equipped, spares; £130, or nearest; solo, £110.—Staite, Radford, Leamington. [X9021

1920 (July) Scott, semi-T.T. bars, lamps and horn, mileage about 600; £137; cost £145; would exchange for A.B.C.—T. Twentyman, Pickering, Yorks. [3354

1915 Scott, lamps and horn, just overhauled, fitted with Henderson featherweight sidecar, in good condition throughout; £95.—Hutchinson, Boroughbridge. [3243

1919 Scott, sports model, wide mudguards, long exhaust, disc wheels, equal to new; £115; no dealers.—Jesse Baker, 46, Market Place, Wigan. Tel.: 457. [2663

SCOTT, 1920, standard model, T.T. bars, electric lamps, Lucas horn, Bonniksen speedometer, small mileage; £110, or nearest.—Siddeley, Crackley, Kenilworth. [X9066

SCOTT 3¾h.p., 2-speed, free engine, lamp, speedometer, good running order, but needs slight repair; £38, or exchange lightweight.—Logan, Fleming Square, Maryport. [2919

SCOTT, 1913, 2-speed, kick start, Bosch mag., semi-T.T., lamps, 2 generators, speedometer, nearly new Dunlops, 3in. rear; £45; after 6.30 or week-end.—Kethro, St. John's Rd., Orpington, Kent. [2867

Scout.

LIGHTWEIGHT 2¾h.p. Scout, Bosch mag., Triumph carburetter, sloping frame and tank, T.T. bars, long exhaust pipe, in good running order; £28/10.—26, Queen's Ter., Southampton. [2238

Singer.

3½h.p. Singer, Bosch, B. and B., perfect order; £45, or nearest offer.—15, Bruce Grove, Tottenham, N. [3063

SINGER, 3½h.p., 2-speed, clutch, Bosch, combination, 1914; £65.—Butts, 15, Haverstock St., City Rd., N.1. [2615

SINGER 2¾h.p., little used, B. and B., Bosch, Druid forks, Grado gear, reliable; £50.—Stevens, 76, High St., Barnet. [2892

SINGER 2¾h.p., single speed, just overhauled, perfect running order, appearance good; £27.—Horgan, 42, Cowley Rd., Brixton. [2202

SINGER 3½h.p., 1914, Bosch, B. and B., perfect mechanical condition, will do 45 m.p.h., Armstrong Mark VI. gear, clutch, tyres good, starts easily, fast, economical, tools, spares, lamps; £45.—Akester, 1, Luther St., Leicester. [X8959

Sparkbrook.

1920 Sparkbrook, 2½h.p., 2-speed, condition as new; £68.—W. Cork, Sheep St., Skipton, Yorks. [X8964

SPARKBROOK, 1920, 2¾h.p., 2 speeds; at makers' price £75.—Eagles and Co., 275, High St., Acton, W.3. [X8984

1919 Sparkbrook, as new, under 800, new lighting set; £55, or nearest.—88, Westcombe Hill, Blackheath. [2192

SPARKBROOK 1919 2½h.p., 2-speed, lamps, C.A.V., perfect condition; £60.—Marchant, 132, Widmore Rd., Bromley Kent. [2193

SPARKBROOK, 2-speed models, £75; from our showrooms.—A. J. Young and Co., Ltd., Heath Garage, Newmarket (Phone: 214), and 75, Albany St., N.W.1. [1099

SPARKBROOK Combination, 8h.p. J.A.P. engine (recently overhauled, cost £18), hood, screen, speedometer, lamps, Voltalite dynamo, 2 gas generators, oversize tyres, new spare (unused), Binks carburetter, insured to May, 1921, condition excellent throughout; £120, or near offer.—Post Office, Northgate, Chester. [2135

Sun.

1920 Sun 2½h.p. 2-speed, kick start, just delivered; list, £70.—Turnill North, Peterborough. [2650

2¾h.p. Sun-Villiers, 1915, powerful, good condition, lamps, horn; best above £30.—92, Fellows Rd., N.W.3. [2559

1917 2¾h.p. Sun-Vitesse 2-stroke, 2-speed, lamps, horn, etc.; £42/10.—Banister and Botten, 34] Upper St., N.1. [2405

BECAUSE OF THEIR QUALITY
insist on
BELDAM
Inner Tubes

THE life of your tyre depends on the quality of the inner tube. Beldam Inner Tubes are of the highest possible quality. They are built up layer by layer from the finest sheet rubber. Beldam Tubes are extremely elastic, of great strength and toughness, and, if correctly fitted, will outlast your cover.

Get a Beldam InnerTube to-day and compare it with any others you are using. You will realise at once the superior quality of the Beldam and why it wears so long.

You get them in a Waterproof Bag

Every Beldam Tube is packed in a waterproof bag, which keeps it fresh and clean and free from damage until you want it.

All standard sizes made. Write for prices.

The Beldam Tyre Co. (1920) Ltd. Brentford, Mid'x.
Godbolds.

MOTOR CYCLES FOR SALE.

Sun.

SUN-VILLIERS 2¾h.p. 4-stroke, o.h.v., 2-speed, K.S., new back tyre, belt, fully equipped, fine condition; £42.—3, Grove Rd., Chertsey. [2618

SUN-VILLIERS 2-stroke, 2-speed, good condition, Al'all saddle, new tyre and belt, lamps, complete; 48 gns.—Herbert Guest, Huntingdon Rd., Thrapston. [X9017

Sunbeam

1914 3½h.p. Sunbeam Combination, fully equipped; £110.—Barnett, Barnett and Co., Deal. [2334

SUNBEAM 1916 3½h.p. Combination, good order; nearest £115.—Potts, High St., Biddulph. [3000

SUNBEAM Combination for Sale, brand new; £203. Norman Whitehouse, Bridgtown, Cannock. [X8861

£55 (nearest).—1915 3½h.p. Sunbeam unit complete, mechanically perfect; see Engines.—Cox. [X9014

1918 Sunbeam 3½h.p., solo, in splendid condition; £120.—Kays, 8, Bond St., Ealing Broadway. [3387

SUNBEAM 3½h.p., 1920, new, not done 100 miles; 148 gns.—Watson Jones, Whitley Manor, Newport, Salop. [2428

1919 Sunbeam, sporting sidecar, electric light, as new; first £155.—Stone, 116, Cheltenham Rd., Bristol. [3234

8h.p. Sunbeam Combination, 1919, spare wheel, good condition; £185.—Burgess, 272, High Rd., Tottenham. [2915

1917 Sunbeam Combination, 3½h.p., with lamps complete; £145.—Kays, 8, Bond St., Ealing Broadway. [3386

£3 Under List.—For immediate sale, new 1920 standard Sunbeam. — Capt. Brittain, Orient Lodge, Buxton. [X9003

3½h.p. Black and Gold Sunbeam, late model, perfect condition, 3 speeds, etc.; price £102/10.—51, Queen St., Hitchin. [2890

SUNBEAM 8h.p. Combination, 1919, perfect condition, lamps, horn, speedometer; £215.—222, Beacon St., Lichfield. [2961

SUNBEAM 1917 3½h.p., kick starter, 3-speed, h.b.c. clutch, lamp, horn, etc., excellent condition; £110.—C. Barton, Clapham, Yorks. [0246

1919 3½h.p. Sunbeam Combination, splendid condition, 2 spare tyres; £150; seen by appointment.—Box 7,063, c/o *The Motor Cycle*. [3286

1920 Sunbeam, 3½h.p., electric lighting, £160; R.F.C. beaver-lined helmet, new, 22/6; flying suit, £4.—133, Barkerend Rd., Bradford. [X9069

AUG., 1920, 3½h.p. Sunbeam Combination, all wheels interchangeable, Lucas lamp sets, horn, tools; £212.—Simpson, Chemist, Ibstock. [X8989

SUNBEAM 2¾h.p., 2-speed, kick starter, good running condition, Bosch mag., just overhauled; £60.—52, Chatsworth Gardens, Acton, W.3. [2865

3½h.p. T.T. Sunbeam, June, 1920, Millford sidecar, Lucas, Bonniksen spares, etc., mileage 800; £200, or offer.—Gilbert, 217, Park St., Luton. [3126

SUNBEAM Combination, 1919 (Sept.), mileage 950, unscratched, carefully driven, unpunctured; any examination; £170.—26, Wanderers' Av., Wolverhampton. [2155

SUNBEAM 3½h.p. brand new, all accessories, any trial; first reasonable offer accepted; after 6 p.m.; engine No. 4977.—14a, Draycott Mansions, Albert Rd., Hendon, N.W.4. [2826

1915 (Sept.) 3½h.p. Sunbeam, 3-speed, etc., new coachbuilt sidecar, new lamps, accessories, excellent condition; reasonable offer.—63, Solon Rd., Brixton. [3548

SUNBEAM 1916, 3½h.p. Combination, excellent condition, new C.B. sidecar, for immediate sale; £150, including insurance.—Gadsden, 77, Chatsworth Rd., Bournemouth. [2270

SUNBEAM Combination 8h.p., late model, electric lights, hood, screen, spare wheel, equal to new; £180 near offer.—Roberts, 81, Dundee Rd., South Norwood, S.E. [3359

1919 (Sept.) 8h.p. Sunbeam Combination, electric lighting, wind screen, hood, and Klaxon; £220, bargain.—Hampton, c/o Boyce, 329, Archway Rd., Highgate, N. [3361

8h.p. Sunbeam Combination, new January this year, accessories, in practically new condition throughout; £250, or near offer.—Seen at Greenwood's Garage, Pangbourne, Berks. [2385

1919 3½h.p. Sunbeam, Henderson sidecar with wind screen, lamps, speedometer, knee grips, tools and spares; nearest £150; Derbyshire.—Box 6,994, c/o *The Motor Cycle*. [2283

1920 8h.p. Sunbeam Combination, hood, screen, Lucas lamps, all spares, spare wheel, not been used, just as from works; £245.—Sanitary Inspector, Lye, Stourbridge. [2491

1920 3½h.p. Sunbeam Combination, as new, low mileage, perfect, Lucas lamps, Cowey horn, mirror, etc.; £200, lowest.—Turner, Saddler, Blackburn Rd., Church, Lancashire. [X8963

This Week's Trials.

FORTY different makes of motor cycles are represented in this week's annual reliability trials of the Auto Cycle Union. It will be recalled that the entry list was limited to 150, and actually 139 names were sent in. Of this number 133 started on Monday last. Right from the commencement of the 918¼ miles trial the hills were severe in the extreme, as those acquainted with the Yorkshire and Northumbrian districts will agree. Writing at Darlington from a recollection of some of the hills which in pre-war days were accepted as freak climbs, it can confidently be forecasted that the conditions will prove quite the most difficult yet encountered. One remembers similar suppositions on the part of competitors on the eve of previous big trials, but there can be no gainsaying that a gold medal in the 1920 Six Days Trials will prove a trophy of which to be proud. After an examination of the 95 solo and 38 passenger machines ranged up in the official garages, one is impressed by their workmanlike appearance and complete equipment.

Worthy of the Test.

Judged as a whole, the machines are magnificent. If any motor cycles in the world are capable of the worst trial that even the A.C.U. can provide, then the 1920 models assembled at Darlington this week will come through all right. Believing, as *The Motor Cycle* does, in the future of the lightweight, we were glad to see fourteen entrants in this class for engines up to 275 c.c. But the course does not favour lightweights. Mountain tracks which no sane man would ever dream of traversing awheel in the ordinary way are there to transmit shocks and exert the greatest possible stresses on frames and fittings. And this is in a measure the weakness of the event, for its very difficulties encourage the piling on of weight to meet extreme conditions to the disadvantage of the ordinary everyday tourist. This explains to some extent why 3½ h.p. machines have gone up from 160 lb. to the modern weight of approximately 300 lb. Weight reduction—*not* addition—should, we again urge, be one of the objects of the A.C.U. in both solo and sidecar machines, and particularly the former. Light weight means economy in tyre wear and general running costs. Single-cylinder engines easily held sway with a total of 69, V twins numbering 49, and flat twins 13. There were also 6 side by side twin two-strokes entered, and 2 three cylinder radial engines, but one regrets that there are no four-cylinder machines in this year's event.

Mudguarding and Silencing.

Improved attention is clearly being paid to mudguarding and silencing, though two-strokes (25 of them were entered) with one exception appear noisy in comparison with the four-stroke engine. The results will bring out the efficacy of the design of these two outstanding items. It is interesting also to note that a 500 c.c. two-stroke made its appearance in this week's trial, and its performance will be watched with considerable interest by two-stroke enthusiasts. Since there are many who look upon this type of mount as foreshadowing the moderate priced passenger machine of the future.

1920 marks the first trial in which radial engined machines have appeared. The Redrup is the latest and most original design of engine in the trial, and represents still another promising type of motor cycle hailing from Yorkshire. Those readers who can do so should see the competitors and their machines at some point or other on the long course. Fortunately, three important districts are embraced.

A review of the features of the machines represented, as well as impressions of the start, appear on another page of this issue, and a full description of the event with personal observations of the performances of the riders will appear in *The Motor Cycle* next Thursday.

An Index to the advertisements in this issue will be found on the page facing the back cover.

Occasional Comments by "Ixion"

Carburetter Lever Arcs.

I HAVE been freak-hilling with one of the modern single-lever carburetters. Its throttle lever tip travels through a curve of about 9in. between the fully-closed and wide-open positions, as is the wont of such beasties. I have such long taper fingers that my fond parents wanted to have me trained as a Paderewski, but this lever quite baffles me. I can't do a lightning close-down with it nohow, and I found freak-hilling very arduous work in consequence. I had to resort to the novice's favourite dodge of cutting out on the exhaust whenever my machine tried to rear over backwards or climb the hedgerows. If these controls are going to become standard, somebody will have to invent a little reduction gear which reduces the length of their arc. Of course, all Yankee lovers will say, "Why not twist grips?" Well, I am always willing to adopt Sinn Fein methods when I quarrel with design, but I don't like twist grips as well as the radial lever: the motion does not seem so easy and natural to me. But, honestly, the radial lever is "na poo" when its arc makes your thumb and fore-finger do splits.

Six Days Innovations.

WE must wait a bit to see how the innovations in the A.C.U. Six Days work out. The track test is obviously thorny to organise, but the brief *résumé* of the published conditions leaves me stone cold. I have before now brought several 3½ h.p. machines through a six days in very rocky condition; but I have only once finished with a 'bus so dud that it couldn't manage 35 m.p.h. for half an hour; and that was umpteen years ago. I opine that every entrant who struggles as far as Brooklands will earn his 15 marks in the "speed" test, unless the full conditions contain some catch not yet announced. The brake test sounds like the real goods; but I hope that a staff of marshals have been engaged to make the men descend at a pukka 10 m.p.h.; otherwise some of the wangling fraternity will have to be sent down the hill more than once. I suppose it would be too much to make the men start down the hill with chains (or belts) removed, and their arms folded until they reach the "stop" flag. (N.B.—I am *not* an entrant this year.) The fast hill-climb will occasion great excitement, but is it going to cut much ice? Either you give no marks for it (in which case it is merely a pleasant interlude); or else you give a lot of marks. In the latter case (making free with names), it is hard luck on a machine like the B.S.A., which has built up a reputation on faithful years of no-trouble service, to ask it to try speed stunts against the Norton, which has always plumped for pace. Until further particulars appear, the innovations have a slight savour of window dressing; but if you are going to permit an entry of 150 machines, it will always be difficult to be fair, exacting, and technical in the several tests.

Against Excessive Weight.

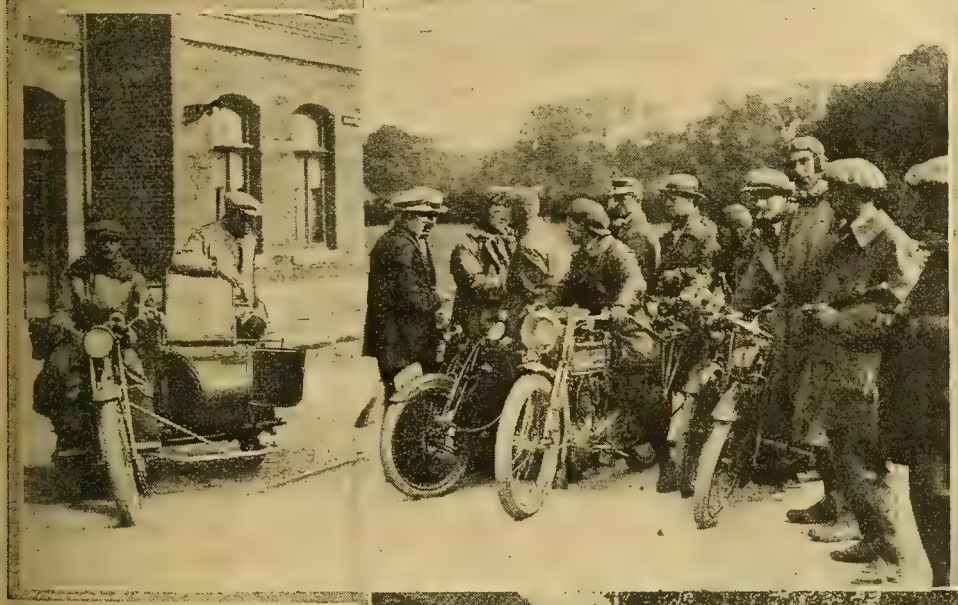
I COMMENTED a few weeks ago on the amazing popularity of baby machines, and especially of the smaller two-strokes. Riders and agents alike inform me that the boom in babies is not merely a question of prices or deliveries, but marks the commencement of a definite reaction against excessively heavy machines. This symptom should be noted by all concerned. Motor cycling is entering upon a new phase, and tapping new strata in the market. The sporting youngster does not particularly mind what a machine weighs so long as it will tote him round. The newer riders are often stout and pursy. They do not always care for high speeds or long distances. Many of them are compelled to store their machines in extremely inconvenient places. For such owners the difference between 2 cwt. and 3 cwt. is more than perceptible. If they accidentally purchase a real heavyweight, they find it a perfect incubus. Tremendous sales await the first genuine touring machine to weigh a bare 1½ cwt. Technically, the problem is by no means insoluble. In the past, first-class 3½ h.p. machines have finished the T.T., though they weighed no more than 160 lb. The motor cycle industry is awaiting an engineer who will do for it what Mons. Mathis did for the light car when he produced in 1914 a three-speeded 10 h.p. two-seater which weighed 8 cwt. as against the 12 cwt. which was then the normal weight for such vehicles. The aeroplane industry has shown what engineers can do when weight reduction is compulsory. Where motor cycles are concerned, low weight cannot become compulsory until one inspired designer sets the example.

Dual-purpose Designs.

I SUPPOSE there is no doubt that the single model policy has tremendous manufacturing advantages. If a firm is going to concentrate on a 500 c.c. machine, for example, it is simpler and more remunerative to design a model which is adaptable for either solo or combination purposes. The rider's interests are, however, diametrically opposed to this policy. The man who wants a 500 c.c. solo machine wants it as light as possible, and this implies that his frame need not be stiff and heavy enough to take the pull of a sidecar. Similar reasoning applies to engine, gear box, transmission, and other items. At present the commercial factors are in the ascendant, and the market contains few — if any — medium-powered machines designed simply and solely for solo tourist purposes. It is a great pity. The solo men may ultimately regain their lost ideals *via* a circuitous path. One or two firms are concentrating on the sports 'bus —*e.g.*, the Duzmo. The sidecar may get in its baneful work once more, and prevent such machines from becoming the acme of lightness. Then a slightly detuned edition of the solo sports model would make a good solo tourist.

The Ideal Alarm.

WHENEVER I attend any big assembly of motor cyclists, I look out for a better alarm signal than I have yet discovered; and so far my search has been fruitless. The bulb horn is too weak for fast men. The mechanical horn is noisy enough, and has been greatly improved by the rounded knobs now so fashionable; but its note is unnecessarily disagreeable, and you must remove a hand from the bar to operate it. Exhaust whistles had a brief vogue some years ago, but our smoky exhausts soon killed them. We want handle-bar control of a penetrating signal with a pleasant note; and, in all probability, we shall have to wait for full electrical equipment before we get this desirable combination. I must frankly admit that on occasions I ride too "blue" to relish a horn on the top tube, whilst an enormous hooter mounted on the handle-bar is bad for steering. Some of the American electric hooters and dial equipments are ahead of ours.

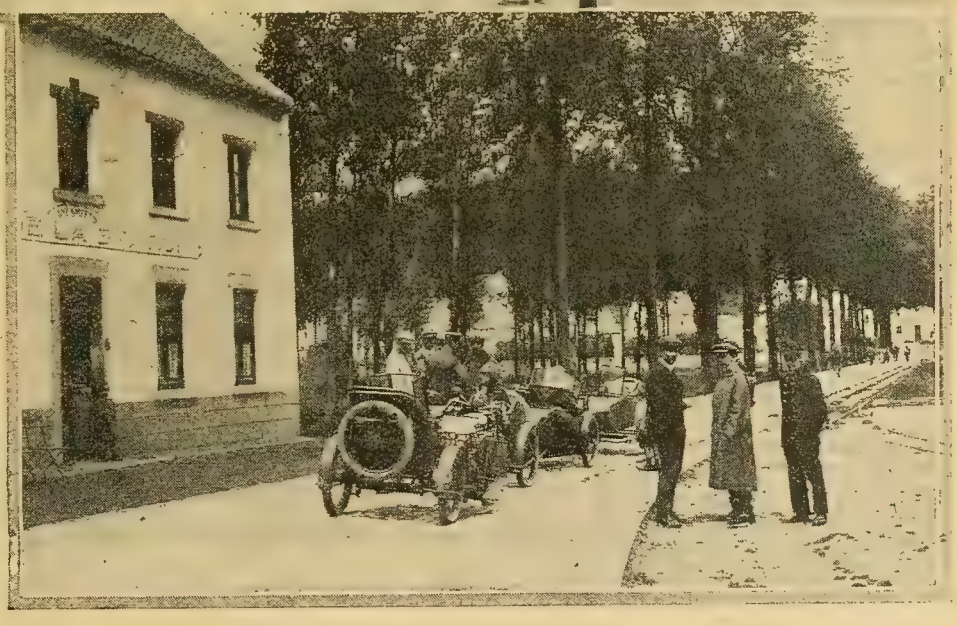


FRONTIER FORMALITIES.

(Top) At Cannes; here competitors have to show their Customs card and national driving licences. The Dutch Customs is about a quarter of a mile away.

(Centre) The Dutch Customs at Cannes, where the same procedure had to be followed. The competitors' destination was about two and half miles away.

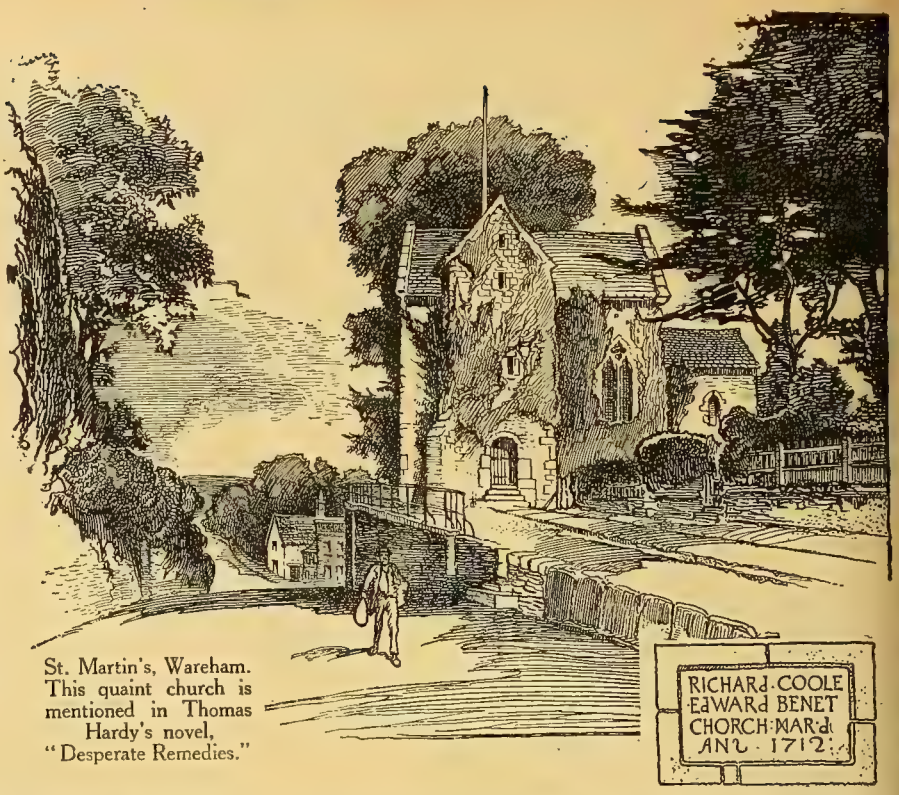
(Bottom) Another view of the Belgian Customs House at Cannes. Their papers having been signed, the riders are about to cross the frontier into Holland. Both Belgian and Dutch Customs officers were kind, courteous, and expeditious.



DAY TRIPS and WEEK ENDS

by C.G. HARPER

SALISBURY TO SHAFTESBURY, SHERBORNE, DORCHESTER, AND WIMBORNE.



St. Martin's, Wareham. This quaint church is mentioned in Thomas Hardy's novel, "Desperate Remedies."

WILTSHIRE and Dorsetshire roads are not of the best. A Warwickshire man would despise their surface, and feel aggrieved at their constant change of gradient; but the explorer who seeks new interests has to take traveller's luck. A great disposing cause of the loose surface we often find in these parts is the sheep-rearing nature of the farming. Driven along the roads, the sheep very soon injure the best of surfaces.

However, the way out of Salisbury is sufficiently good. Leaving the city from the Poultry Cross and proceeding past the railway station into Fisherton, we reach Wilton through the long avenue of elms that makes so gracious a feature of these first miles. We turn left to enter Wilton, that little town once thought important enough to give a name to the entire shire of Wilts before ever Salisbury came into being. It was the capital of the tribe called the "Wilsaetas." To-day it is remarkable only for Wilton House and Park, the seat of the Earl of Pembroke adjoining; for the carpet factory, and for an odious modern church built in the Italian style in 1844, and replacing a modest English building. This was the doing of Sidney Herbert, Lord Herbert of Lea. It is worth the traveller's while to examine closely this pretentious and costly building; and he will probably be in agreement with the present writer that it was an error of taste which could not possibly be repeated to-day.

In the old town of Shaftesbury there are many quaint streets, this one—Gold Hill—being one of the most characteristic of the historic town

At Barford, in three miles, we turn left and cross the river Nadder, following a switchback road through Compton Chamberlayne and Fovant. Away on the left, at an average distance of one mile, the lofty downs run parallel for some miles. They are the characteristic sheep downs of Wiltshire, lonely except for the flocks, the shepherds, and their dogs. They grow nearer as we proceed by Swallowcliffe and Austy Hollow, whence the road descends to Brookswater. The hollow at Austy is romantic, and so is that by-way on the right which leads in one and a half miles to the picturesque ruins of Wardour Castle, battered in the sieges of 1643 and

Day Trips and Week-ends.—

1644, when Lady Arundell gallantly defended it in the absence of her husband. She was one of the several forceful combatant dames of that time who warred with desperate courage on one side or the other; Lady Bankes, of Corfe Castle; Lady Brilliana Harley, of Brampton Bryan, the mighty Bess of Hardwicke; and others.

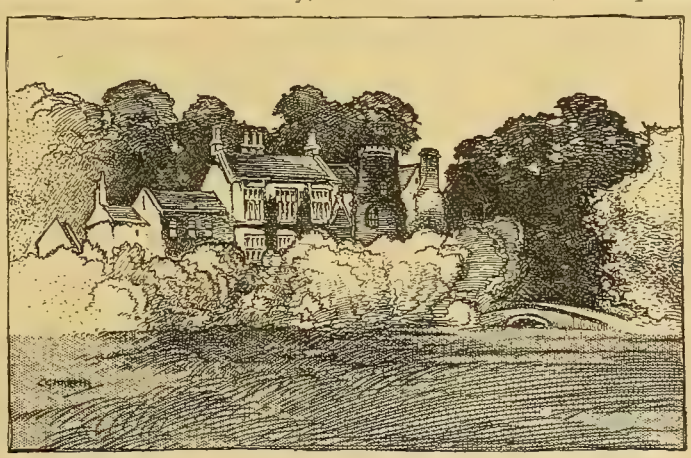
Cerne Abbey; on the hillside can be seen the figure of the "Cerne Giant." Cerne village, once a busy community, is now a small hamlet.

Faded Splendour.

A steepish rise leads into Shaftesbury, that grey, quiet, time-worn and weary old town on the hill: the ancient place called variously "Shaston" and "Palladour," which once possessed twelve churches, an abbey, and three mints. It is difficult, looking upon the town to-day, to realise that ever it was thus. Of the abbey only the site and some broken tiles are left; there are but three churches (two of them modern), and it is scarcely necessary to say that there is not any mint. We have come sharply up into Shaftesbury, but by the easiest road into it. All others are very steep indeed, and one is frankly impossible, being, indeed, in the nature of a cobble-stone staircase. It is called "Gold Hill." Truly, there is nothing so interesting in Shaftesbury as the view from it: that wonderful view over the vale of Blackmore. We shall see exactly how steep and long are the hills when leaving for Sherbourne. The road seeks the level in many turns, and comes down into the vale at East Stower. Passing that and the sister village of West Stower, the cross-roads at Henstridge Ash are gained. Here is the "Virginia Inn," traditionally one of the spots where Sir Walter Raleigh smoked his first pipe. He smoked that first pipe (by tradition) in at least five other places. We expect that of so brilliant a figure of history and romance.

Links with the Spacious Days.

Milborne Port, in four miles, has a name which might lead the stranger to suppose it a port for ships. But it is not. This pleasant little town takes the second part of its name from the ancient Port family, long since extinct. The tennis court, prominently adjoining the church, is a curious old feature, built for the game of wall tennis. It is but two and a half miles into Sherborne, a pleasing and busy little market town, whose great and noble abbey church gives it the appearance of a cathedral city. We approach by Oborne and the outlying Castleton, where, on the left, are the ruins of an ancient Sherborne Castle, and the stately mass of a newer, old enough, however, to have been partly built by the unfortunate Sir Walter Raleigh, who had never any good fortune after this old property of the Abbots of Sherborne had been granted to him.



Wolverton House, a picturesque feature of Charminster. It is the old home of the Trenchards.

A Sermon in Stone.

The chief cause for the cheerful appearance of Sherborne is the lovely colour of the stone of which the abbey and many of the houses are built. It is the local golden-yellow Ham Hill stone: seen, however, in its greatest beauty within the abbey, where it is worked into that final triumph and glory of Gothic architecture, the fan-vaulting of the early years of the sixteenth century.

At Sherborne we turn south for Dorchester, nineteen miles—a charming and excellent road, part of the old coach route from Bristol to Dorchester and Weymouth. The long rise surmounted, and passing Long Burton, the distant heights of Dorset, crowned with eerie clumps of trees, appear. The loftiest of these is High Stoy, which, together with the crests of Bulbarrow and Dogbury, looks very imposing. The road descends into level lands at Holnest. It is a most endearing region of scrub-woods, and extremely rural. Here on the right is Holnest Lodge, once a seat of that eccentric person of many names, J. S. W. Sawbridge Erle-Drax, M.P. for Wareham, an exceedingly wealthy and conceited squire, who has left his mark on Holnest Lodge by erecting a lofty column in front of the house in honour of himself and in default of anyone else being likely to do it for him. It is surmounted by a bronze statue of himself, in frock coat; and altogether is a quaint and laughable affair. The squire, long since gathered to the bosom of Abraham, or of Ahrimanes, lies in a vast mausoleum which he built in the churchyard. It overshadows the humble church.

Picturesque Decadency.

From Middlemarsh we climb to those downs seen in the distance, and, passing Minterne Magna, come to Cerne Abbas, which lies chiefly to the left of the road. Cerne is an extreme example of decay. It was once a market town, but is now a derelict village, too tired to complete the act of dying. But, oh! so picturesque, with the old abbey gateway, and the sun-baked and windswept downs enfolding it lovingly. On those downs there is seen the great outlined figure of the "Cerne Giant," 180ft. long, supposed to have been traced

Day Trips and Week-ends.—

there by the worshippers of the sun god Heil, about A.D. 600.

Dorchester is reached in seven and a quarter miles, past Nether Cerne and Charminster, where the manor house of Wolverton is glimpsed on the left, the old home of the Trenchards. On the right, approaching Dorchester, is the Roman camp of Poundbury, used of later years as a camp for German prisoners of war. We turn sharp to the left into Dorchester, that prosperous town, meeting-place of many roads, and, descending its main street, emerge by a right turn at Fordington on to the Wareham road. It is sixteen miles to Wareham, delightful all the way, through Broadmayne, Warmwell Cross, Owermoigne, and Wool, where Wool railway station, Woolbridge old manor house, and the Gothic bridge over the river Frome oddly neighbour one another. Wareham itself is a quiet old town, enclosed within ancient earthworks, relics of a day when it needed all the protection it could get from marauding Danes and Vikings, who assailed it by way of Poole Harbour. There are old churches at Wareham, notably that of St. Martin: all too large for the small population. Heath roads are mostly our portion onwards, past Lytchett Minster, with its oddly-named "Peter's Finger Inn," and thence (avoiding a right-hand turning for Poole) to Fleet's Corner, where we bear left at the fork of roads for Wimborne.

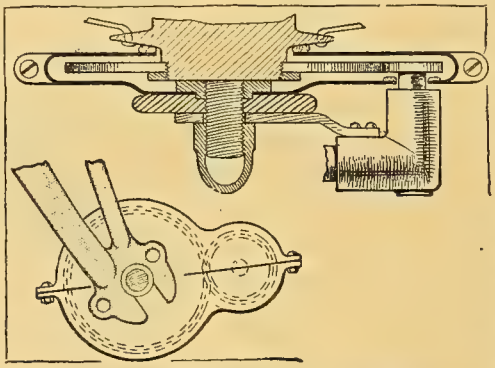
Wimborne's interest is in its Minster Church, Norman and Early English: a grand relic, containing a library of chained books and the curious tomb of Anthony Etricke in the wall of the south choir aisle. It is a chest of polished slate, decorated with coats of arms and bearing a date in large numerals, oddly altered from 1691 to 1703. The explanation given of this is that the chest was prepared in his lifetime, and that he expected to die in 1691. By reason of grace, he had an extension of twelve years.

In nine and a half miles we come to Cranborne, marked on most maps in larger letters than it deserves, for it is a very tiny and primitive place; and then by a lonely and indifferent road in seven miles to the main Blandford and Salisbury road, at Coombe Bisset Hill, five miles from Salisbury. By the time we have reached the city, we shall have covered 106 miles, through many towns and villages, each of which has something of interest to offer.

Covers for Speedometer Drive.

A Suggestion for the Refinement of a Detail sadly needing Attention.

IT has often been suggested in the pages of *The Motor Cycle* by "Ixion" that the cog-wheel which drives a speedometer should be screwed on an extension of the front hub instead of the rough and ready method of attachment to the spokes by means of a number of screws. This, as has been pointed out, would save much trouble in adjustment, and the speedometer drive could be attached easily and quickly by the veriest novice. (The present plan requires a certain amount of time and skill.) It would be a very simple matter for the manufacturers of motor cycles on the one hand, and of speedometers on the other, to agree upon a standard thread which could be placed upon the hub of every machine and covered with a washer and locking ring. These would be removed when the speedometer was fitted, the drive screwed on to the flange and the locking ring returned to its place. The removal of the wheel, which would have to be done in any case, would be the most tiresome part of the operation.



Showing how the fitting of a speedometer drive might be carried out.

The advantages of all this are very obvious, but the benefit need not end here. The fact of the driving wheel having a small space between it and the spokes would allow of the fitting of a neat cover for the speedometer drive, and this would improve its wearing qualities and render it more silent—both very desirable objects. The accompanying illustrations show how this could be carried out quite effectively. The case could be made of any sheet metal (aluminium would perhaps be better) split horizontally and held in position by being gripped between the fork and the flange of the cone. Dust could be excluded by the use of felt washers at the two openings. Such a case would also enable the speedomter drive to be effectively lubricated.

WEATHER AND THE MOTOR CYCLIST.

UNDOUBTEDLY the very indifferent weather prevailing during this summer has been responsible for the easing off in demand which in some quarters is regarded as a "slump." The enormous and ever increasing circulation of *The Motor Cycle* is sufficient proof that there is no falling off in interest in motor cycles.

At this time of the year there is bound to be less multiplication of enquiries than in the early spring, as new comers to the pastime have not yet learned that the motor cycle is an all-the-year-round utility mount. It is the prospect of summer rides in the country that first attracts the man who has never before owned a motor vehicle. The weather has been very bad this year, and many potential owners have deferred buying on this account. However, according to an Italian statistician, good and bad "seasons" run in cycles of seven years,—and next year is to be the first of a promised seven years of fine weather summers. Let us hope so! VEDETTE.

An impression of D. Danskin at speed on his 75 m.p.h. Rover.

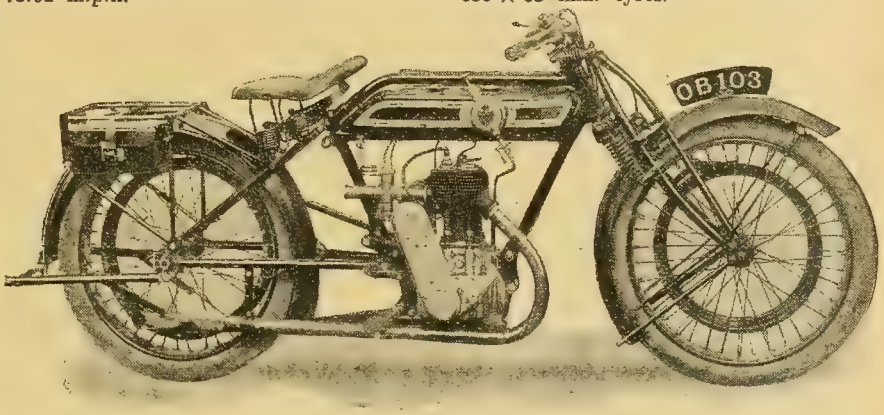
SEVENTY-FIVE miles per hour! Such a speed is only appreciated by those who know the difficulty of obtaining even 65 m.p.h. The kilometre record stands at 82 m.p.h. for a 500 c.c. machine; but this speed is not for the average owner of a T.T. mount. Generally, any 500 c.c. machine built for road as well as track work, capable of exceeding 65 m.p.h. may be regarded as being above the average.

Realising the demand among the young clubmen for a simple solo single capable of good performances in those local speed events so dear to the clubman's heart, the New Rover Cycle Co. has of late been experimenting to speed up its standard T.T. model. The machine illustrated is the result. It is capable of 75 m.p.h., and this without any suggestion of freakishness in the engine or a specially lightened frame.

Certain parts of the engine have been redesigned, and stronger valve springs have been fitted, but otherwise the machine is standard.

On a quarter of a mile of quiet and unfrequented stretch of road we last week timed D. Danskin on one of these machines, and he covered the distance in 12.50s. and 12.25s. respectively on two runs. This works out at 71.99 m.p.h. and 73.47 m.p.h.; but the day before, when the conditions were slightly more favourable, the same rider had accomplished the quarter mile in 12s. dead = 75.01 m.p.h.

This modified T.T. Rover is practically the same as the catalogued machine, excepting for the slight alterations in the engine and the absence of a silencer. Its specification includes a roller big end bearing to the connecting rod, an E.I.C. magneto, B. and B. carburetter, and 650 × 65 mm. tyres.



The modified 3½ h.p. T.T. Rover.

SPRING CARRIERS—AN EXPERIENCE.

SEVERAL correspondents having urged the advantages of the spring carrier as a suitable means of carrying spares and equipment, I decided to purchase a spring pillion seat specially to transport my baggage (of an inanimate nature, of course!).

The device selected was equipped with a large tool bag and in this was placed all the most vulnerable spares, such as sparking plugs, repair outfit and chain links. These parts had remained in almost perfect condition in the ordinary pannier bag of my rigid-framed machine for some six thousand miles, but as I projected a long tour in Scotland, some better insulation from the vibration of bad roads was considered advisable.

After covering nine hundred miles I got my first puncture and opened that spring supported tool bag. Horrors! The plugs, once in separate leather cases, the chains once tightly packed in rag, and the repair outfit were one pounded mass of fragments!

The tyre repair was affected by the *débris* of the outfit, and the plugs were carried in my pocket for another three hundred miles, unserviceable until the threads had been rechased in the lathe. What is the lesson to be learned? The pillion seat is normally sprung to carry the weight of an average person; with any less weight, or entirely unladen, the bouncing and vibration set up by the uncompressed springs is infinitely worse than anything to which the rigid carrier is subjected, and, in consequence, damage to anything carried thereon may be expected. In the case in question the springs could not be readily adjusted (or some of their number removed) to carry a load of a few pounds, and as a result the jolting of the carrier was intensified by their violent oscillations.

In order to be suitable for luggage carrying (where only light loads are concerned), the springs of a pillion seat should be instantly adjustable for tension, otherwise the rider is advised to attach any light and delicate articles *rigidly* to some rigid part of the motor cycle frame.

WHARFEDALE.

SIX DAYS TRIALS REPORT NEXT WEEK.

In the next issue of *The Motor Cycle* a complete description of the A.C.U. Six Days Trials will be published, with many exclusive illustrations.

OVERSEAS SECTION

A Commentary based upon Practical Experience and a Study of Overseas Opinions.

International Competitions.

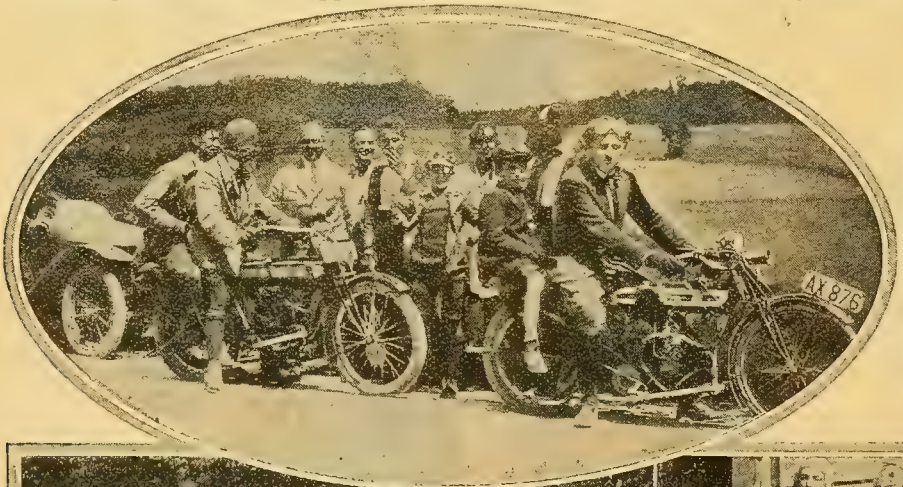
THERE is an aspect of International trials quite apart from the cementing of national goodwill, which is bound to result whenever two nations meet in friendly contest. We refer to opportunity afforded British manufacturers to show their product to riders of other countries. For this reason, perhaps, it was regrettable that more British makers did not compete in the International Six Days Trial in France. It must not be forgotten that France is now a motor cycle manufacturing country, and that a very different state of affairs exists from that which prevailed prior to the war. The motor cycle manufacturers of that country promise to become noteworthy competitors to British and American houses in the Continental and Overseas markets.

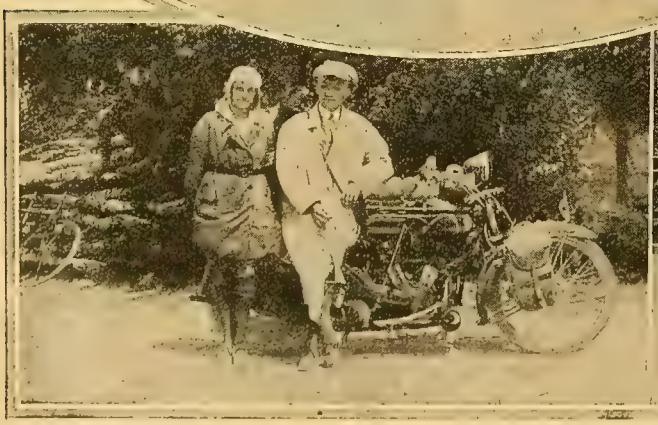
The motor cyclist and potential motor cyclist on the Continent is a new generation, and it is thought in some quarters that an opportunity was lost when makers on this side of the Channel overlooked the value of the publicity of such a trial to demonstrate their products in a sadly neglected market.

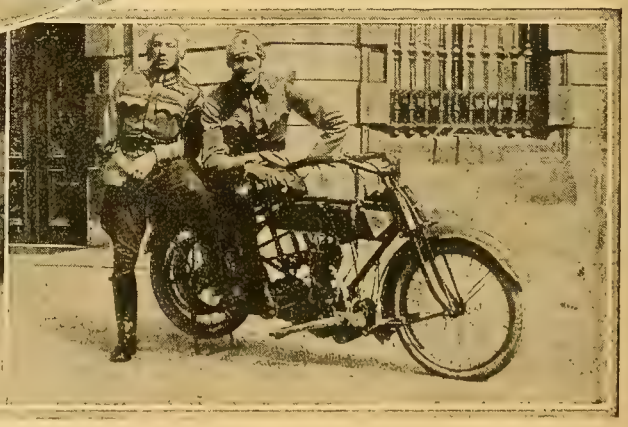
♆ ♆ ♆

Criticism of British Viewpoint.

FROM time to time we receive letters from Overseas motor cyclists severely criticising British methods, and while we appreciate the difficulties of our manufacturers, we cannot but admit that many of the complaints are justifiable. This week's mail bag contains a letter from a Continental rider who is under the impression that British manufacturers assess any event outside Great Britain on its publicity value in this country, and not on its value as propaganda for future overseas trade. It is also thought that enterprise is lacking, and that there is a tendency for manufacturers to consider past and present business as a basis for justification, or otherwise, instead of the







BRITISH MOTOR CYCLES IN CZECHO-SLOVAKIA.

It is a good sign to hear of the motor cycle enthusiasm displayed in a country which has for so long been in a state of unrest. Our Czecho correspondent, who sends the photographs, says that great keenness is shown at speed trials, which are organised on similar lines to those held in England. The top photograph depicts a scene at a speed event, the two machines shown being a Rudge and Douglas.

(Left) A Clyno outfit; the lady, like her British sisters, is not content with the sidecar seat, but takes turns on the saddle.

(Right) Two B.S.A. enthusiasts, one of whom has lost an arm, the other a leg.

Overseas Comments.—

uture. We have observed this tendency ourselves, nd in some quarters have been told by certain makers hat, "Our business in —— does not justify the cost f entering competitions in that country." Surely otential, and not past, demand should be the basis f valuation.

❦ ❦ ❦

The Anglo-Dutch Trial.

THE recent international trial in Holland must react in favour of British motor cycles in that country. The Dutch people depend almost entirely upon imported motor cycles, and are prepared to buy the machines they know to be satisfactory. Every machine that was ridden by members of the English team in the Trial referred to proved its reliability, and, if this goodwill is used to advantage, the makers must benefit in no small measure. There were also British machines in the Dutch team, but their value had already been assessed by the Hollanders, or they would not have been chosen to represent Holland in the Trial.

Although the members of the British team were mounted on British machines, their opponents' mounts were a mixture of British, American, Belgian, Dutch, and German productions. With one exception all the British team made non-stop runs—a really remarkable performance—but four Dutchmen stopped, and these were debited against one rider of a British machine and three who were mounted on Americans. Now if the Trial is finely analysed by buyers in that part of the Continent, they must be impressed by the superiority of those machines which came from this country.

If non-stops are taken as the basis of reliability, then the following may be said to be the international results:

British machines	24	22	non-stop.
American machines	9	6	,,
Belgian machine	1	1	,,
German machine	1	1	,,
Dutch machine	1	1	,,

Based on percentages, the individual instances shown above take pride of place, but in a case of this kind a high proportion of non-stops in a large number of starters, as happened amongst the British machines, is decidedly more meritorious.

A Selection of Letters from Readers scattered all over the World.

Take Your Own Machine to India.

A correspondent from Cachar, India, protests against the prices asked for British machines in his district. "The price charged for British machines here is past words," he says. "Profiteering is not in it! I bought my machine new in August last, and brought it out with me in December. The import duty is only 7½% on the owner's valuation of the machine, and it can always be shipped as personal luggage. In my case I had no steamship freight to pay. I should also advise anyone taking a machine out to have it very securely packed in a totally enclosed case."

An American Likes British Machines.

MR. K. T. ROBINS, an American reader, favours British machines after experience with them during the war. Writing from Rochester, N.Y., he says: "I have been a constant reader of *The Motor Cycle*, and I receive it here regularly every week.

"In my opinion, American motor cycles certainly have some very good points over English machines. Twist grip control, one of the most prominent factors on American motor cycles, is by far the best means of control. The heaviness of the motor cycle, combined with horse-power, tank capacity, large wheels and tyres, certainly helps to make motor cycling a pleasure. "I have had a lot to do with Triumphs, B.S.A.'s and Douglases, both in the British Army and in civilian life, and I must say give me the English machine every time."

Manufacturers' Treatment.

A reader in Rawalpindi, who signs himself "India," draws attention to the high prices of British machines, and compares them with the cost of American big twins. A 4¼ h.p. B.S.A., he says, is advertised by an agent at a price equivalent to £206 13s. 4d. (1,600 rupees), and proceeds:

"Recently in one shop in Karachi I saw a brand new Triumph and a brand new four-cylinder Henderson standing side by side. The price of the former was Rs. 1,625, and that of the latter Rs. 1,650—roughly £215 each. It makes one tired to hear all this hot air about British goods when this sort of thing exists. The manufacturers themselves are the people to blame. They exercise no check on their agents' prices and actions, and if private individuals write them direct, they reply referring us to their agents.

"Of twenty firms to whom I wrote for specific details of machines suitable for certain specified rough work here, not a single firm replied giving me clear answers to my tabulated questions. Some simply stuffed a sheaf of literature, which did not answer many of my questions, into an envelope.

"The two firms who have made more song about Overseas conditions and the suitability of their machines for these than any other firms actually gave me less information than others.

"Consequently, after treatment of this kind, followed by the most casual attention to personal calls when in England some months later, I have now gone in for a big American twin, and have also been responsible for the purchase of several others by my friends, who acted on my advice."

Scooter Possibilities in India.

On the subject of motor scooters, an Indian correspondent agrees that a seat is an absolute essential. "There is room for these miniatures out here," he says, "provided they are fitted with a seat, but they must be good, light, strong, economical, and cheap to buy. At half the price of the cheapest motor cycle they should find a ready market."

Shaft Drive Wanted.

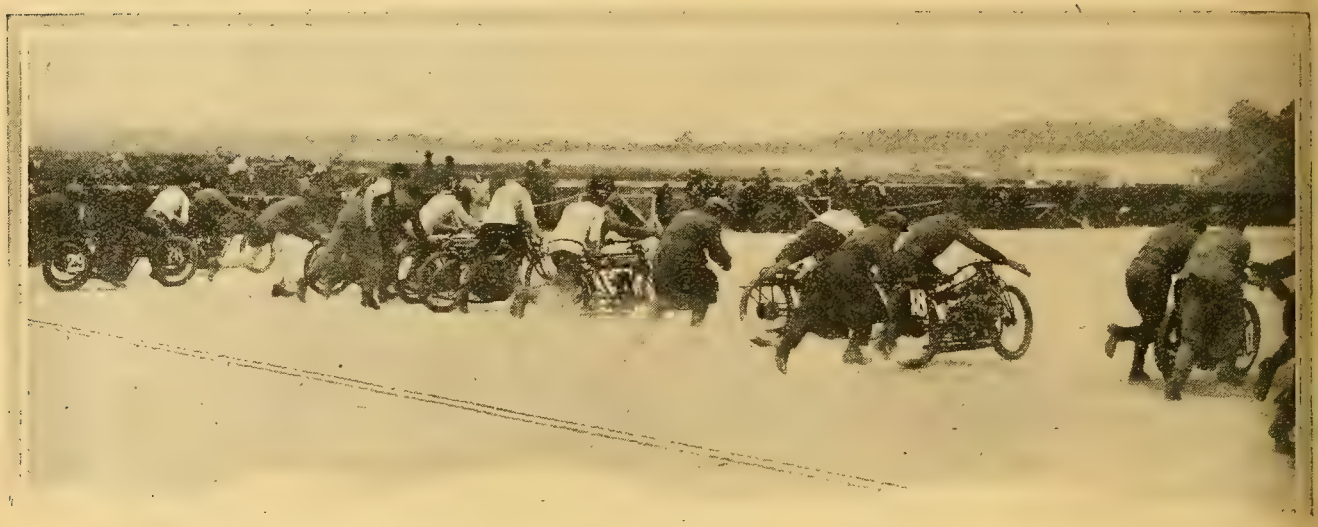
MR. J. H. D. HIRJI-KHOORSHID, of Hyderabad, Deccan, writes about his ideal machine as follows: "Having been an enthusiastic reader of long standing of your very valuable paper, I have often read different readers' comments on various models of motor cycles for Colonial use, and I beg to offer a few ideas of an ideal machine, with a hope that some enterprising British manufacturers will put one on the market with all the necessary spare parts at a reasonable price, inclusive of all the necessities.

"*Brief Specifications.*

"1. 4 h.p., horizontally-opposed twin cylinders.
"2. Spring frame.
"3. Shaft drive (as per the celebrated F.N.).
"4. Drum brakes, with hand and foot controls.
"5. Detachable wheels with a spare wheel.
"6. Mechanical lubrication, with sight feed.
"7. Binks carburetter, with extra air lever.
"8. Electric lighting dynamo, with magneto.
"9. Three-speed countershaft, with kick-starter.
"10. Speedometer, with engine attachment.
"11. Petrol indicator, with filter tap, attached to tank capable of holding two gallons of fuel and half a gallon of lubricating oil.
"12. Hand and foot clutch (dry plate).

"I believe that the celebrated Douglas, with the exception of No. 3, is the ideal mount, and if this renowned machine is turned out with a shaft drive it will be a boon to the Douglas enthusiasts. It is a pity that the manufacturers do not realise the immense benefit of the shaft drive. A Douglas so turned out, with all the above-mentioned attachments (which, by the way, is very easy to do), will, no doubt, command a better market throughout the world, asserting the superiority of the British manufacture—'British, therefore *best*.'"

TIME TRIALS AT BROOKLANDS.



Fifth B.M.C.R.C. Members' Meeting. 275 c.c. Kilometre Record Broken.

THE fifth B.M.C.R.C. members' meeting was held at Brooklands on Wednesday, August 18th, and at the beginning of the programme the first 1920 time trials were run off.

A strong wind blowing from the south-west caused considerable difficulty during certain portions of the races, but aided those who competed in the kilometre speed trial, in which some excellent speeds were attained. The first trial, Class A1, for motor bicycles not exceeding 275 c.c., attracted one entrant only, whilst the remaining five classes were well supported. Result :

CLASS A.1.—FOR MOTOR BICYCLES NOT EXCEEDING 275 C.C.

	Mile.		Kilom.	
	Time.	Speed.	Time.	Speed.
*W. A. Jacobs (Singer)	62.4	57.69	38	58.87

CLASS B.—FOR MOTOR BICYCLES NOT EXCEEDING 350 C.C.

S. Bailey (Douglas)	52.2	68.97	32.2	69.47
T. Eve (Matchless)	54.4	66.18	32.4	69.04
V. Longden (Douglas) ..	57.4	62.72	34.6	64.65
Tudor Thompson (Douglas)	58.6	61.43	35.2	63.55
E. Longden (Dot-Jap) ..	59.8	60.81	37	60.46
J. F. Hull (Wooler)	64.8	55.56	40	55.92
E. Longman (Wooler) ..	67.4	53.41	40.8	54.83
F. MacNab (Wooler) ...	69	52.17	42	53.26
S. Gill (Alecto)	69.8	51.58	42.6	52.51
A. Watson (Douglas) ...	73.8	48.78	43.6	51.32
G. Senior (A.J.S.)	77	46.75	50.6	44.21

CLASS C.—FOR MOTOR BICYCLES NOT EXCEEDING 500 C.C.

V. Horsman (Norton) ..	46	78.26	27.6	81.05
J. Emerson (A.B.C.) ...	47.6	75.63	28.2	79.32
S. L. Bailey (Douglas) ..	48.4	74.38	29	77.14
H. Martin (Matchless) ..	48.8	73.77	29.8	75.07
J. Patterson (Norton) ..	50.4	71.33	31	72.15
A. Miller (Matchless) ...	50.8	70.87	30	74.57
H. Harveyson (Indian) .	51	70.59	30.4	73.58
L. Pope (Matchless)	52	69.23	29.6	75.57
F. Collard (Rudge)	52	69.23	33.2	67.38
J. Newall (Lea-Francis) .	61.4	58.63	37.2	60.13
M. Lapize (Rudge)	65.6	54.88	38.6	57.95
B. Remington (Rudge) .	68.4	52.63	41.2	54.27

CLASS E.—FOR MOTOR BICYCLES NOT EXCEEDING 1,000 C.C.

H. Harveyson (Indian) .	42	85.71	25.2	88.77
L. Remington (Nut-Jap)	42.2	85.31	25.4	88.07
O. Baldwin (Matchless) .	44	81.82	27	82.85

CLASS H.—FOR MOTOR CYCLES AND SIDECARS NOT EXCEEDING 750 C.C.

V. Gayford (Zenith)	51.8	69.5	30.6	73.1
R. Dequin (Zenith)	63	57.14	37.8	59.18

CLASS I.—FOR MOTOR CYCLES AND SIDECARS NOT EXCEEDING 1,000 C.C.

E. Baragwanath (Zenith)	51.56	69.82	31.22	71,65
H. Jepson (Zenith)	53	67.92	32.2	69.47
J. Chater-Lea (Chater-Lea)	55.6	64.75	33.8	66.97
O. de Lissa (Motosacoche)	55.8	64.52	33.4	66.18
L. Pope (Harley-D.) ...	78.2	46.04	48.2	46.41

* In Class A.1. W.A. Jacobs, astride the same Singer on which he established the flying kilometre record on April 17th, 1914, broke his own record. His previous speed was 57.65 m.p.h., as compared to his latest speed of 58.87 m.p.h.

The first race, the Junior Scratch Race for motor cycles not exceeding 350 c.c., attracted twelve entrants, all of whom got away well.

At the conclusion of the first lap T. Eve (Matchless), S. L. Bailey on his overhead valve Douglas), and H. Thorpe (Douglas) led the field, and as the leading machines crossed the line on their third lap T. Eve's machine was missing badly, and Bailey had overhauled him, whilst Thorpe was now running second.

S. L. Bailey won easily, and Thorpe, who had retained his place, came in second, followed by Tudor Thompson. S. Gill, who recently established and broke several records, retired during the second lap. Results :

	Speed.
1. S. L. Bailey (Douglas)	59.94 m.p.h.
2. H. Thorpe (Douglas)	—
3. Tudor Thompson (Douglas)	—

The Senior three-lap scratch race for motor cycles with engines not exceeding 500 c.c. provided one of the closest and most exciting finishes ever witnessed at Brooklands. At the end of the first lap Horsman was leading, followed by Porter, Emerson, S. L. Bailey, Miller, Dallison, Martin, Pope, Harveyson, Collard, and Gard.

Porter led in the second lap, and after him came Horsman, Emerson—these three in a bunch—then Bailey, Miller, Pope, Harveyson, Collard, and Gard. In the final lap Emerson was leading as the finishing line was approached, with Horsman second, but Porter apparently had plenty in hand, and shot forward winning by a length. Result :

	Speed.
1. E. Porter (3 A.B.C.)	70.69 m.p.h.
2. J. Emerson (3 A.B.C.)	—
3. V. Horsman (3½ Norton)	—

The all-comers' one lap scratch race provided no such excitement as the last race. Sidecars and three-wheelers were to have been included, but none materialised. Davidson and Sawer were quickest off the mark, and Miller, who was not ready when the flag fell, failed to start. Result :

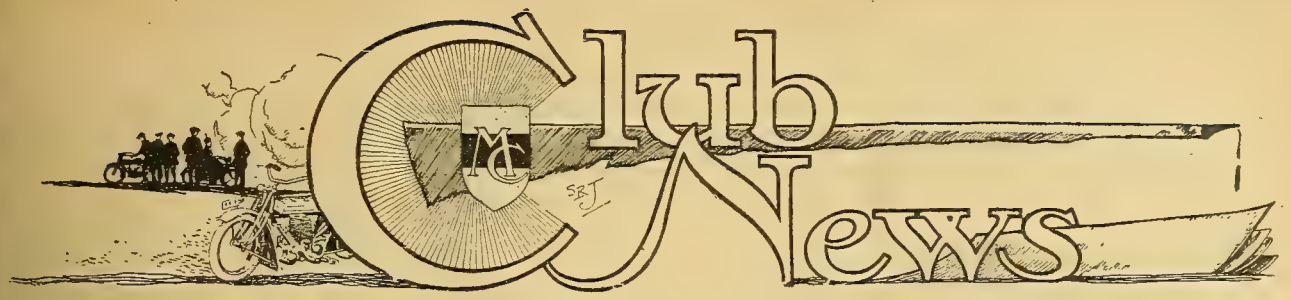
	Speed.
1. E. Remington (8 Nut-Jap)	71.84 m.p.h.
2. J. R. Harveyson (3½ Indian)	—
3. G. L. Sawer (7-9 American X)	—

The all-comers' solo handicap (three laps) came to a sad end. There were thirty-six entries for this event, and only three non-starters, and there was every prospect of a fine race, but the rain which had been threatening all the afternoon came down with a vengeance. Belts slipped on many machines, one after another fell out during the second lap and the race was eventually stopped.

After an interval it was decided to run off the Ealing handicap (two laps) for motor cycles, sidecars, and three-wheeled cars owned and driven by a member of the Ealing and District M.C.C. The winner, P. Cunningham, rode a brand new P. and M. in full touring trim, which he had only just purchased and put up a speed of nearly 50 m.p.h.—a very fine performance. The first lap order was : Cunningham, Hyem, Tilbury, Longman, Malone, Davidson, and Keogh, whose machine was missing badly (it was raining at the time). Cunningham won easily. Result :

	Start. m. s.	Speed. m.p.h.
1. P. Cunningham (3½ P. & M.)	2 38	49.81
2. P. J. Malone (7-9 Harley-Davidson) Scr.		—
3. D. H. Davidson (7-9 Harley-Davidson)	14	—

Owing to the bad weather the meeting was then abandoned.



North Lindsey A.C.

The result of the reliability trial held by the above club on August 14th, over a very sporting course, is as follow: 1, Reg. Smith, 5 marks lost; 2, T. Goodson, 8 marks lost; 3, Jos. Beaman, 10 marks lost.

North-Western Centre A.C.U.

The North-Western Centre A.C.U., which comprises the clubs affiliated to the A.C.U. in Lancashire, Cheshire, and North Wales, is holding a hill-climb on September 12th, and has also decided to run a trial over a secret course on the 26th prox. The hon. sec. is Mr. J. H. Place, 8, Dugdale Road, Burnley.

Leeds and District M.C.

The results of the recent trial to London and back, held in conjunction with the Bradfield, Wakefield, and Hull clubs, were as follow:

Gold Medal and Trophy: J. H. Leuty (Calthorpe).
Gold Medals: Major W. H. Oates (Lagonda), S. Jepson (6 A.J.S.), W. Atkinson (4 Triumph), and R. J. Brown (7 Indian).
Silver Medals: F. E. Wasling (Ford), T. Hardy (8 Enfield), R. Almond (4 Triumph), C. L. Adams (3½ Rudge), W. Wood (4 Triumph), W. E. Asquith (6 A.J.S.), and C. F. Lane (3½ Rudge).
Bronze Medals: W. N. Jackson (4 Triumph) and J. Ford (7 F.N.).

Night Trial of the Westmorland Club.

The Westmorland Motor Cycle Club held its first night trial on the 14th inst., from Kendal to Portobello and back, the course being 140 miles each way. All the machines entered were single cylinders, Triumphs and Nortons being well represented. There was only one sidecar competing and that was ridden by Bryan Jefferys, a one-legged rider, who was on the 4 h.p. Norton, which he rode successfully in the York-Edinburgh run. His brother rode the 3½ h.p. Norton, which gained premier honours in the same trial. The first machine left Kendal at eleven o'clock on Saturday night, the weather conditions being ideal. The course was laid over Shap Fells to Penrith and Carlisle, Lockerbie, Moffat, and Edinburgh, but the return journey was made *via* Galashiels and Hawick. Portobello was reached by all machines promptly, but on the return run many riders had to stop owing to being too early at the checks. The first machine was timed to return to Kendal at 6.30 on Sunday evening. Not one of the competing machines had a mechanical breakdown, and the only tool kit unstrapped was that of Byran Jefferys, who encountered a puncture close to Edinburgh. The results were as follow: 1, Bryan Jefferys (4 h.p. Norton and sidecar); 2, Guy Jefferys (3½ h.p. Norton); 3, R. R. Rothwell (Triumph); 4 (equal), R. P. Roddick and P. Hoggarth (Triumphs); 5, M. Sedgwick (Triumph).

Future Events.

Aug. 28.—North Lindsay A.C. Speed Trials.
Aug. 28.—Sheffield and Hallamshire M.C.C. Competition.
Aug. 28.—N.M.C.F.U. (Wolverhampton). Reliability Trial

Aug. 29.—Macclesfield and District M.C. Hill-climb at Axe Edge.
Aug. 29.—Sutton M.C.C Surprise Run
Aug. 29.—Leeds and District M.C. Run to Kirkham Abbey.
Aug. 29.—Rochester, Chatham, and District M.C. Inter-team Trial.
Aug. 29.—Nuneaton and District M.C.C. Run to Berkswell.
Aug. 29.—Southampton and District M.C. Run to Hayling Island.
Aug. 29.—N.M.C.F.U. (Leeds). Speed Trials.
Aug. 29.—N. Wilts M.C. and L.C.C Run to Stratford-on-Avon.
Aug. 29.—Exeter M.C. and J.C.C. Run to Babbacombe.
Aug. 29.—N.M.C.F.U. (Portsmouth) Run to Hayling Island
Aug. 29.—Westmorland M.C.C. Reliability Trial.
Aug. 29.—Scarborough M. and M.C.C. Reliability Trial.
Aug. 29.—Warrington M.C. Run to Llangollen.
Aug. 29.—Reading and District M.C and L.C.C. Run to Dorking.
Aug. 29.—Harrogate and District M.C.C. Social Run.
Aug. 29.—Bedford and District M.C. and L.C.C. Ladies' Day.
Aug. 29.—Derby and District M.C. Run to Dukeries.
Sept. 2.—Norwich and District M.C. Hill-climb.
Sept. 4.—N.M.C.F.U. (Sheffield). Sports at Cordwell Valley.
Sept. 4-5.—Coventry and Warwickshire M.C. Touring Trial to Llangollen.
Sept. 5.—North London M.C.C. Inter-club Run.
Sept. 10-11.—Essex M.C. Reliability Trial, London-Bala-Dunstable.
Sept. 11.—B.M.C.R.C. Members Meeting.
Sept. 11.—Coventry and Warwickshire M.C. Hill-climb at Stile Cop.
Sept. 12.—North-Western Centre A.C.U. Hill-climb at Heyden Bridge.
Sept. 18.—B.M.C.R.C. Open Meeting.
Sept. 25.—B.A.R.C. Meeting at Brooklands.
Sept. 26.—North-Western A.C.U. Reliability Trial.
Oct. 2.—B.M.C.R.C. Championship Meeting.

The Bradford, Leeds, and Hull Two-day Trial.

The results of the recent Yorkshire-London-Yorkshire Trial, organised by the Bradford, Leeds, and Hull clubs, are as follow:

Briggs Cup: S. M. Haigh (3½ P. and M. sc.).
Hodgson Cup: Geo. Townsend (3½ P. and M.).
Gold Medals: D. H. Rhodes (3½ Scott sc.), H. K. Watson (3½ Scott sc.), H. Langham (3½ Scott sc.), C. Knowle (3½ Scott sc.), F. Smith (3½ Triumph), A. R. Naylor (3½ Triumph), F. Scriven (9.6 Hampton), F. Spencer (9.6 Hampton), C. Sidney (3 A.B.C.), and C. B. Haigh (3½ P. and M. sc.).
Silver Medals: H. Harrop (3½ P. and M. sc.), A. Mortimer (3½P. and M. sc.), J. Leyland (3½ P. and M. sc.), J. Spencer (7 Indian sc.), A. Fearnley (4 B.S.A.), W. E. Anderton (3½ P. and M sc.), Geo. Allen (3½ P. and M. sc.), D. Parkinson (2¾ Sunbeam), A. Dovener (3½ Scott sc.), and A. Holyroyd (3½ Scott sc.).

Norwich and District M.C.

Amongst the various classes included in the Ringland hill-climb to be held on September 2nd is an "old crocks" class for machines built prior to 1914.

Cardenden M.C.

Witnessed by several thousand spectators, the newly formed Cardenden (Fife) Motor Club held a successful hill-climb on the 11th inst. The winners were: Class 1, under 350 c.c.: J. Beveridge, jun. (Douglas). Class 2, 600 c.c.: J. Reed (Norton). Class 3, unlimited: T. Stewart (8 Zenith), and fastest time of the day. Class 5: C. Carden (7-9 Harley-Davidson).

Birmingham M.C.C.

A hill-climb at Stile Cop is being organised for September 4th by this active club. Twelve classes will be available, including scooters on time only, and on time and formula for motor cycles of 250 c.c., 300 c.c., 350 c.c., 499 c.c., 600 c.c., 750 c.c., and unlimited. There will also be two sidecar classes, 499 c.c. and unlimited, on time and formula, and one for cycle cars up to 1,100 c.c. on time only. An interesting event will be for the four fastest machines of the day, for which there will be no entry fee. A long list of prizes is offered, and the entries are: Trade, 15s. first entry, 10s. 6d. subsequent entries, and 12s. 6d. and 8s. 6d. respectively for private owners or amateurs.

Coventry and Warwickshire M.C.

Owing to a clashing of dates with another Midland club, the Coventry and Warwickshire M.C. hill-climb has been postponed until September 11th. The programme for this event includes fourteen classes as follows: 300 c.c. and 350 c.c. for amateurs, 350 c.c. open, touring machines up to 500 c.c. for amateurs and for all members, 501 c.c. to 650 c.c. sidecars up to 500 c.c., and up to 650 c.c. for amateurs, and unlimited sidecars for all members. Cycle cars and light cars up to 1,100 c.c., light cars up to 1,600 c.c., both for amateurs; any light car up to 1,600 c.c., open to all members, and unlimited cars.

Among the awards two challenge cups are being offered. The entry fees are 5s. for first entry, and 2s. 6d. each subsequent entry for motor cycles and sidecar machines; 10s. 6d. and 5s. 6d. respectively for cars. Entries close on Saturday next, and should be sent to Mr. Gordon Francis, c/o Francis and Barnet, Lower Ford Street, Coventry.

A week-end touring trial has been arranged for September 4th and 5th, when members will journey to Llangollen.

The Miniature as a Utility Mount.

Scooter Evolution: The Practical Possibilities of the Type.

JUST as the crude cycle cars of 1911 created prejudice, which for some time reacted upon the better productions introduced by responsible engineers, so is the earlier type motor scooter causing confusion where genuine miniature motor cycles are concerned.

We repeat what we have often stated, that there is a very certain field of utility for a miniature machine with an open frame and a comfortable seat, and confirmation of our early prophecies concerning the ultimate decline of the stand-up type scooter and rise of the seat type miniature is to be found without seeking. Those makers of the former who have seen the truth of our contentions and who have developed their machines into miniature motor cycles, will, we think, admit that the latter have proved to be the better proposition, both from a selling point of view and from the standpoint of the user.

Seats Almost Universal.

Few indeed are the people who prefer to stand when they can sit comfortably, and while one or two hardy riders have undertaken long journeys in the former position, we do not think any private owners of such machines have attempted a journey of, say, one hundred miles.

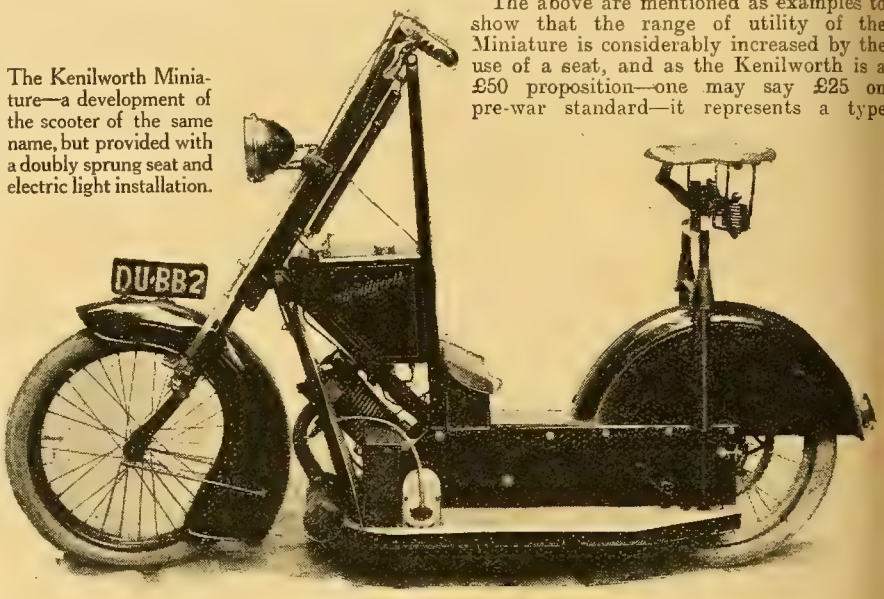
On the other hand, owners of some of the better known seat type miniatures frequently use them for journeys such as are undertaken on a fully fledged motor cycle.

The Kenilworth Miniature is one of these, and as proof of its popularity as a utility mount, it is interesting to observe that in the city of its origin—Coventry—and the residential districts adjacent, there are many in use by owners directly and indirectly connected with the motor industry, who use them for runabout purposes, such as home to office service and visits to the links or tennis courts.

We have before us letters from owners in various parts of the country who have undertaken long journeys on these machines. Amongst these is one from two ladies who recently rode from Coventry to Brighton—a distance of 145 miles. The first seventy-five miles were covered in about six hours' running time. These ladies previously owned two-stroke motor cycles, and affirm their preference for the Kenilworth on account of its lighter weight, increased comfort and cleanliness. Another owner made a journey from Redhill (Surrey) to Gloucestershire—a distance of 145 miles in eleven hours—with a petrol consumption of 130 m.p.g.

The above are mentioned as examples to show that the range of utility of the Miniature is considerably increased by the use of a seat, and as the Kenilworth is a £50 proposition—one may say £25 on pre-war standard—it represents a type which fills a gap undoubtedly existing at the present time between the pedal bicycle and the orthodox motor cycle.

Incidentally, the Kenilworth is a well-made and finished machine, fitted with a small but highly efficient four-stroke engine having an outside flywheel and overhead valves. It is manufactured by Booth Bros., Coventry.



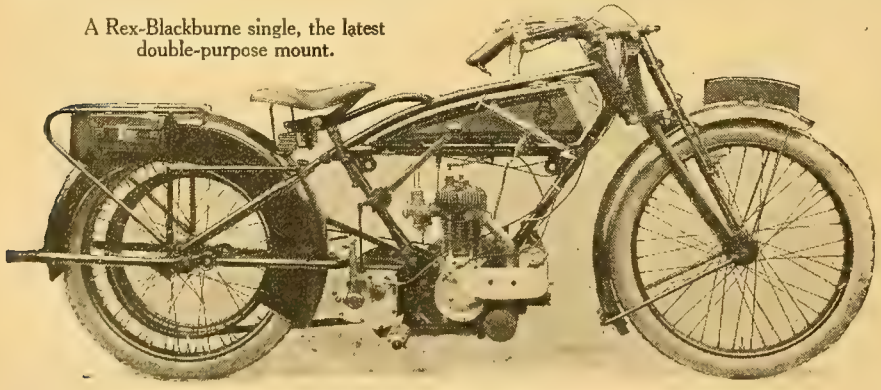
The Kenilworth Miniature—a development of the scooter of the same name, but provided with a doubly sprung seat and electric light installation.

A Dual-purpose Rex.

New Single-cylinder 4 h.p. Blackburne-engined Model for Solo or Sidecar Use.

QUITE a number of British motor cycle manufacturers consider that in developing the De Luxe sidecar machine, another just as profitable field is being neglected. We refer to the dual-purpose machine—handy enough for solo work and suitably built for propelling a sidecar—which prior to the war was the most common type of motor cycle on the market, and which has subsequently suffered no loss of popularity.

The Rex Motor Manufacturing Co., Coventry, hold this opinion, and for some time their experimental department has been at work on a machine on the lines we have indicated.



A Rex-Blackburne single, the latest double-purpose mount.

Although following the main lines of the Rex twin model and the Model 77 big single, the new machine is smaller, shorter, and consequently much lighter than those machines which were designed exclusively for sidecar work. As will be seen from the illustration, the new model has extremely pleasing outlines, and since its equipment consists of very popular units—*i.e.*, 4 h.p. Blackburne engine, Sturmey Archer gear box, 28×2½in. tyres, Brampton forks, Rex cantilever saddle pillar, and adjustable handle-bars—and its finish the same which characterises all the company's post-war products, it will undoubtedly prove a very popular machine.

Sidecar Lugs Incorporated.

The illustration shows that sidecar fixings are integral with the frame, and that the rear stay lug is incorporated in both stays, so that the machine may be used for continental sidecars without alteration.

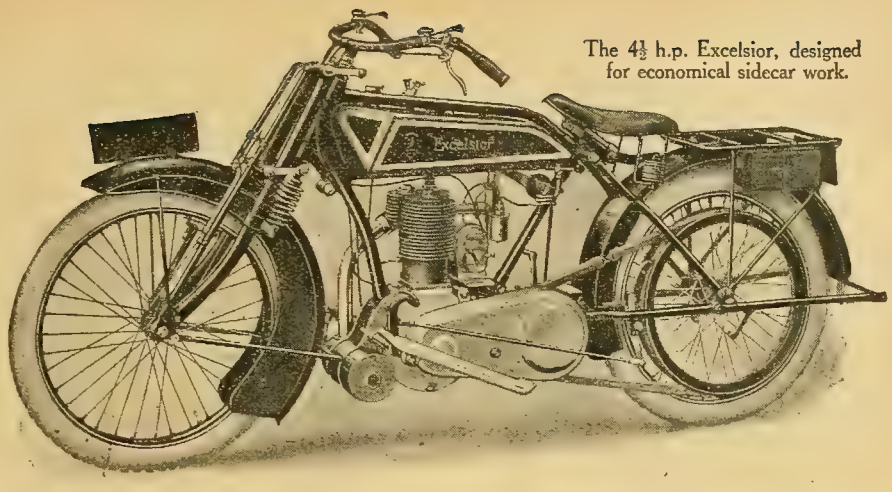
A special sidecar is being produced for this machine.

A Big Single Sidecar Machine

4½ h.p. British Excelsior Revived.

DESPITE the general tendency for the sidecar machine to become a de luxe outfit with, in some cases, over-elaborated equipment, there are still manufacturers who appreciate the value of the market which exists for a machine at a more popular price. To render such machines a commercial proposition, many post-war luxuries, such as enclosed chain drive, dynamo lighting, hoods, screens, and detachable wheels, have to be omitted. Some, however, favour this simplicity.

Among the several machines of this type now available is the new 4½ h.p. Excelsior, which embodies an 86×112 mm. (650 c.c.) engine, with which the makers were very successful before the war, and a conventional specification includes Sturmey-Archer gear, 650×65 mm. Dunlop tyres, Hans Renold ⅝×⅜in. chain, 1in. Dunlop belt, C.A.V. magneto, Senspray carburetter, and Druid forks. The price of the machine is £125, or with coachbuilt sidecar £160. The makers are Bayliss, Thomas and Co., King's Road, Tyseley, Birmingham.



The 4½ h.p. Excelsior, designed for economical sidecar work.

A Wolf with 350 c.c. Blackburne Engine.

The latest name to become associated with the Blackburne 350 c.c. engine is the Wolf, a new model of which, embodying this engine, is shown above.

AS an intermediate between the lightweight and the 500 c.c. single, the 350 c.c. single-cylinder has taken a firm hold of the riding public. It has long been recognised that an engine of a size sufficient to propel a sidecar is unnecessarily large for purely solo use, while the motor cyclists who formerly used 500 c.c. machines of the lighter type require something a little larger than the popular lightweight. The 350 c.c. machine fills this need, hence the increasing popularity of the 2¾ h.p. Blackburne engine unit, which seems to find new sponsors every week.

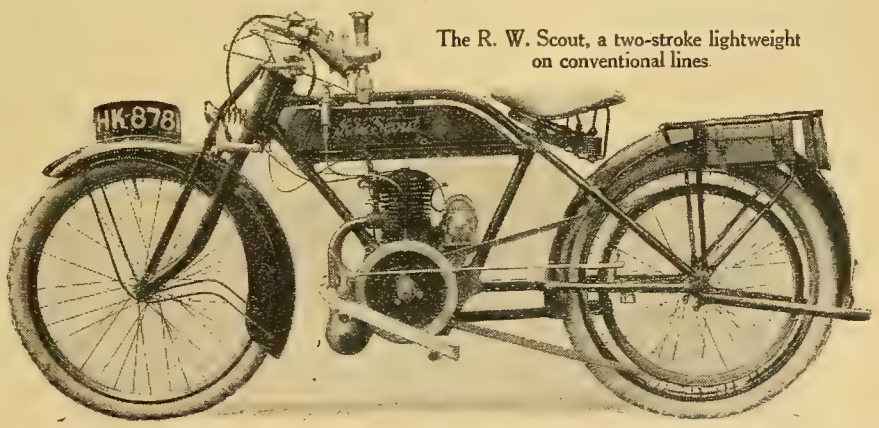
One of the latest firms to adopt this engine is the Wulfruna Engineering Co., Ltd., of Wolverhampton, who have succeeded in producing a mount of very pleasing lines. The specification includes Brampton Biflex forks, Dunlop 26×2¼ heavy tyres, Sturmey-Archer two-speed gear, with kick starter and hand-controlled clutch.

The finish is all-black with the tank relieved by a gold line, and the provisional price is 105 guineas.

A Dalm-engined Scout.

ONE of the latest entrants to the lightweight market is a 3 h.p. R.W. Scout motor cycle, which is equipped with a 73×76 mm. (318 c.c.) Dalm two-stroke engine. The characteristics of this unit, it will be remembered, include the provision of double exhaust ports and exhaust pipes, which are said to eliminate "four stroking."

The new pattern Amac carburetter is fitted, and an E.I.C. magneto supplies the current for ignition. Saxon forks, large mudguards, and 26×2½in. three-ply Beldam tyres form part of its equipment. Direct transmission is provided by a ¾in. Dunlop belt. A two-speed model is also marketed.



The R. W. Scout, a two-stroke lightweight on conventional lines.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters must be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

ASSISTING COOLING.

Sir,—I noted in the "Questions and Replies" columns of *The Motor Cycle* of July 29th that "F.W.C." wishes to fit aluminium fins to the cylinders of his 3 h.p. Enfield in order to keep his engine cool. He will probably be surprised to know that accurately carried out experiments with air-cooled cylinders showed that by adding aluminium fins or other "gadgets" for the purpose of keeping the cylinder cooler actually resulted in increasing the cylinder temperature by 10° C. approximately.

The cylinder temperature was found by means of thermo-couples, and was measured in two places in the region of the exhaust valve seat.

D. P. MUIRHEAD, A.M.I.A.E.

COURTESY ON THE ROAD.

Sir,—Not long ago you gave an article in your paper on the experience of various cyclists in trouble and the lack of courtesy accorded to those in distress. May I give you my experience as a direct contradiction of the facts you stated? I was riding a Baby Levis near Sloane Square when the engine stopped and no persuasion in my part would start my machine. I was accosted by a gentleman, who suggested various remedies and eventually came to the conclusion it was the plug. He took it out for me, and soon put matters right, so that I was able to get to my destination without further trouble. I can assure you I was extremely grateful for the assistance rendered, and I trust this letter will prove that not all to whom assistance have been given proceed on their way without the usual thanks for services rendered, and my sincere wish is that at some future date I may, in return, be able to give some one in distress, like myself, some help, should the occasion arise.

R. T. PROUDFOOT.

CHAIN DRIVE ON SPRING FRAME MACHINES.

Sir,—Your correspondent "T" is, I am sure, correct in his statement about the necessity of concentric movement between the countershaft pulley in springing the driving wheel of a motor cycle. What he says with regard to a chain-driven machine is, in a lesser degree, true of the belt-driven machine; it stands to reason that the extra strain on the belt must in time tell.

Most makers get over the difficulty of the unconcentric motion by seriously restricting the springing of the machine. About an inch seems to be the average, and, in my modest opinion, it is not sufficient. From personal experience, 2½in. gives a delightful sense of comfort, which is a revelation to anyone trying it for the first time, similar to the effect of riding in a well-sprung car. E.F.H.

Southampton.

Sir,—"T's" letter, *re* "Chain Drive on Spring Frame Machines," in *The Motor Cycle*, August 12th, is the first letter, so far, which is getting on the right track.

But, although being *almost* correct in saying that the centre of pivot of spring should be coincident with the countershaft sprocket spindle, this, by itself, will not maintain the transmission tension constant.

Two other things are absolutely necessary to achieve this, one of which is so simple that it is surprising that so far the principle has escaped attention, and for the idea one is indebted to the locomotive, or, rather, Stephenson. The other is a means for maintaining the centre of the fulcrum (not pivot) *always* coincident with the centre of the final transmission, even when the countershaft is moved.

In conclusion, I wish to inform "T" that I have completed a design for a rear springing system, which maintains transmission tension and centres constant irrespective of the amount of the movement of the wheel, and that this design is now being fully protected. There are two designs, one specifically for the Scott and the other for standard machines. In both the principle is the same as mentioned, with the two necessary additional features, one of which I am not just now disclosing. G. HAROLD DURSTON.

[Several patents have been filed which cover the point mentioned by our correspondent. The springing system of the Coventry Premier Runabout also embodies this feature.—ED.]

A UNION OF MOTORISTS.

Sir,—Is it too much to hope that one day the A.A. and the R.A.C. will amalgamate and form a sort of Motorists' Union? Surely we should then be in a position to insist upon fair treatment in the way of taxes and the price of petrol. The "Union" officials should have power to order a strike—"all vehicles off the road"—and so bring the Government and oil companies to their senses. "All vehicles off the road may not *sound* much, but the consequent dislocation of business would be enormous. I am no Bolshevist; on the contrary, my King and country come first, right or wrong, but I do believe that the people who pay should have their say. Personally, I should sadly, but gladly, miss my machine. And that brings me to another little matter which I am sure must be of interest to thousands of your readers. Many of us bear the mark of the Hun, and being deprived of the total, or partial, could not the Government, on the question of taxes, be induced to show a little consideration towards men who are compelled to "mote" or stay at home? GRINGO.

Bristol.

DETAILS OF BUSINESS.

Sir,—One would imagine that the object of motor cycle manufacturers and accessory dealers advertising in your pages is to call the attention of the public to the fact that they have these goods and are anxious to supply them.

In our big cities business people are far more ready to communicate by telephone than by letter, and most readers do so if they can, yet out of 225 displayed advertisements in your issue of August 12th I note that only eighty contain a telephone number. One of your client's advertisements states "they" invite enquiries, and yet omits the telephone number. This seems to me to be particularly unenterprising, as the reader who wants to communicate with a manufacturer, dealer, or agent through the telephone turns naturally at once to the advertisements in *The Motor Cycle* in preference to the telephone directory.

Many manufacturers, agents, and dealers who display their goods for sale in *The Motor Cycle* are unkind enough not to let readers know the price of them, and this involves great hardship on Overseas readers of your paper, as I have noticed before in the Correspondence columns. Prices are continually changing, and since this is so, the current price should always appear in the advertisements. Nothing can be more galling to the Overseas reader than to have to write to the Homeland so as to know the price before giving an order. This procedure means anything from six to nine months, or even a year's, delay.

If the business of the country is to be rebuilt, surely the details to which I call attention should not be ignored!

Harpenden. OBSERVER.

GARAGE REPAIRS.

Sir,—"L.P.," Plymouth, has brought up a point of considerable importance when he complains of the manner in which motor cycle repairs are carried out in some garages, but he is hardly fair to the trade when he implies that this is "in nearly every case." There are many garages in the country specialising in motor cycle work, in which experienced fitters and turners are employed exclusively for overhauls and repairs, boys and apprentices being kept in their proper place. Unfortunately, what he says is often only too true; on the one hand the file and hacksaw merchant is the culprit, and in a large number of cases the large garage which does mainly car business. In the latter the motor cyclist is looked upon as a nuisance, and suffers accordingly.

There is another side to every opinion, and "L.P." would be well advised to take it into consideration. From actual experience I can definitely state that, when it comes to repairs, the average motor cyclist is a far more difficult customer to deal with than the car owner, especially when qualified men are employed on the job. Good men get big wages: the motor cyclist is usually of moderate means. It often takes as long to tackle a bicycle job as it does a car owing to the delicacy of the parts in comparison, and often their inaccessibility. When the owner is presented with the bill, which in reality shows the proprietor only a fair profit, there is a scene. The motor cyclist writes to the papers about profiteers, whilst the garage owner tears his hair, sacks his men, and employs boys in the hope of meeting the motor cyclist's pocket. Then "L.P." comes along, doubtless being quite willing to pay a fair price for a good job, gets badly bitten, and he writes to the papers.

There is always the remedy, as "L.P." states, of refusing to pay for "dud" repairs, but a much more satisfactory method is to inspect the garage workshop and satisfy oneself first that the job is likely to be properly executed, instead of handing in the work on chance and kicking up a row afterwards.

If "L.P." cares to call on the writer, he can see motor cycles being repaired by real live mechanics, who are motor cyclists themselves. H. F. W. FLOWER,
Plymouth Branch, Exeter Motor Cycle Co.

ROADSIDE CONVERSION.

Sir,—The following "get-you-home" tip for converting the overhead mechanical inlet of Rudge, M.A.G., N.S.U., Harley-Davidson, and Indian engines to automatic working in the event of a breakage of the rocker or long tappet rod, may be of use to some of your readers:

Take the inlet tappet out of the timing case and dismantle the rocker on the inlet valve dome. Unscrew the dome and take the strong spring off the inlet valve, and put in the place of the usual inlet valve spring a light coil spring. Make quite sure that the spring is only just strong enough to close the valve. Replace the dome, and knock a small plug (a sharpened pencil will do) into the guide in the top of the dome in order to make the dome airtight.

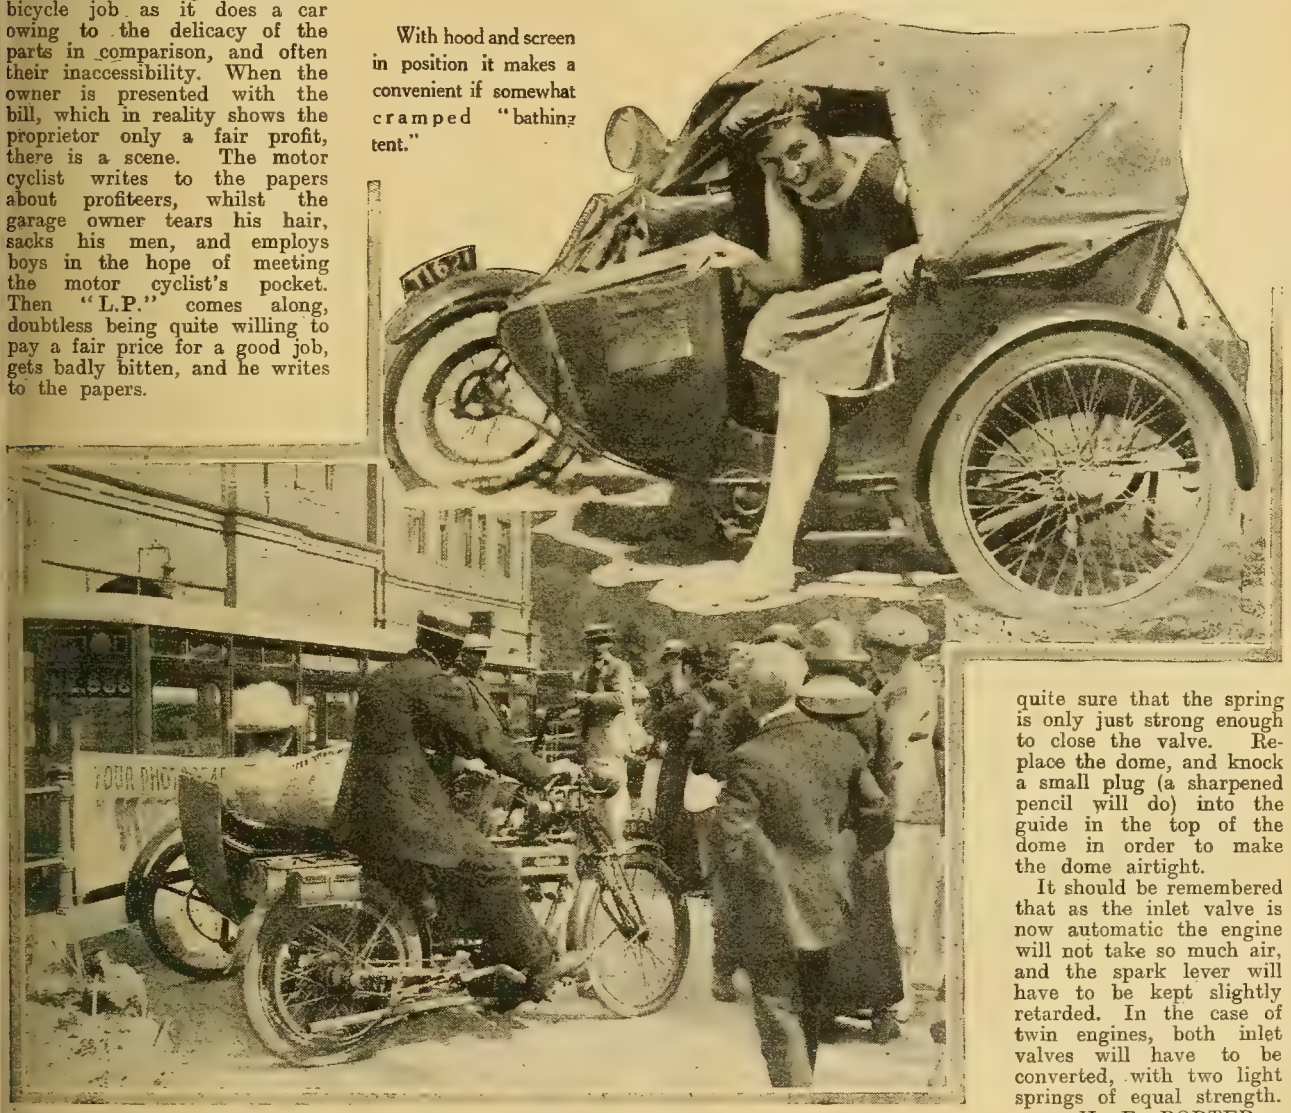
It should be remembered that as the inlet valve is now automatic the engine will not take so much air, and the spark lever will have to be kept slightly retarded. In the case of twin engines, both inlet valves will have to be converted, with two light springs of equal strength.

H. E. PORTER.

[A suitable light spring is usually to be found on the plunger of the tyre inflator.—ED.]

ANOTHER USE FOR THE SIDECAR.

With hood and screen in position it makes a convenient if somewhat cramped "bathing tent."



ONE SHILLING WHILE YOU WAIT.

There are many people who enjoy the fun of make-believe Here are people posing in a sidecar belonging to the photographer who appeared to be doing good business in an inland watering-place, charging one shilling a photograph.

A MOTORISED LADIES' BICYCLE.

Sir,—I was interested with the picture of the Auto Wheel lightweights in a recent issue of *The Motor Cycle* and venture to send you a photograph of an Auto scooter that I have designed and made in the little village of Fulbourn, utilising an Auto Wheel for the driving power. I may say that its capabilities are really wonderful for such a small engine. It is very light, weighing 60 lb., will travel 4 to 20 m.p.h., and is a good hill climber. It may interest the numerous readers of *The Motor Cycle* to learn what can be done with the small unit if fitted to rear forks of any cycle, this being direct drive, gains power and speed, and saves the tyre wear considerably.

A neatly-designed motorised ladies' bicycle. The power unit is an Auto Wheel. (See letter, C. J. Beckett.)

C. J. BECKETT.

BLEA TARN PASS.

Sir,—I have read with interest your correspondent's remarks on the above in *The Motor Cycle* for August 12th. May I point out that the trip in question was organised by myself, and was the result of a wager made by Mr. J. Westwood Wills and myself with certain officials of the Cumberland Club who claimed that a clean climb of this hill, without putting a foot to the ground, and at the first attempt, was impossible.

As events proved, these gentlemen were mistaken, but whether the hill was in good condition that day or not, both Mr. Wills and I are quite prepared again to accept a wager, and to essay a clean climb, when the hill is in the worst possible condition, the Cumberland Club to be the judges in this respect.

J. A. NEWMAN.
Hon. Trials Sec., Worcester and Dist. M.C.C.

OIL IN THE T.T.

Sir,—We issued to the trade recently a poster dealing with the result of the T.T. races which, by inadvertence, claimed more for Castrol than it should have done. On discovering the error we at once took steps to withdraw all copies issued and substitute a corrected poster, but as a complaint has reached us from another lubricating oil firm that some of the originals issued are still being exhibited, we should be extremely glad if you would allow us to state the facts in your columns.

The first place in the Senior T.T. race has been won on each occasion since 1911 by riders using Castrol. In 1913 this oil was also used by the third in the Senior event and second in the Junior, and in 1914 the two riders who tied for second place in the Senior and the third in the Junior were again assisted by our lubricant.

C. C. WAKEFIELD AND CO., LTD.

SPARE PARTS.

Sir,—As an occasional contributor and enthusiastic reader of your paper, may I be allowed to back up "Ixion" in his remarks *re* spares? I do 1,000 miles touring monthly for seven months in the year, but beyond the usual tool outfit supplied by the Douglas people, do not carry a single spare, except a belt and tube. My Douglas was received on January 1st, has gone perfectly, the plugs are still A1, valves quite unworn, and, what is more, in three long tours—London to Falmouth and back and a host of smaller trips this year—not a single part of the machine has shaken loose either on the road or off it. Therefore, it seems that the modern machine, if carefully driven and periodically examined, say once every 1,000 miles, needs no spares, and can be thoroughly relied on. *Re* plugs: Two Lodge plugs lasted me 15,000 miles on a 1914 P. and M., and gave no trouble. My present mount is very light on belts and tyres. Can one of your readers give me a tip to prevent my brake pedal turning over on to the footboard?

May I remark *en passant* that if the names of "reasonable" hotels in the country could be published (I would be pleased to give several) it would be a great boon.

C.M.-T.

PLUG EFFICIENCY.

Sir,—In answer to the letter from "Unknown" in *The Motor Cycle* of May 27th *re* Bosch plugs.

I have had just the same experience. The Bosch plug I have on my machine has been in use for eight years, and though the porcelain dome is chipped and pitted all over I dare not risk using another plug, especially on a long run.

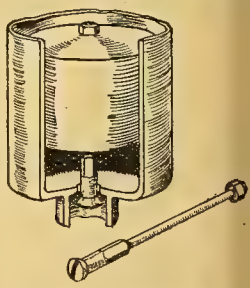
The secret, I think, is in the alloy of which the metal points are made. The points will not bridge over with carbon as is the case with our plugs. But there is one plug which comes up to the Bosch, and that is the Bethlehem (Indian) American plug. I find my engine ticks over most regularly and there are no signs of pre-ignition at the fastest speed.

INDIA.

COURTESY ON THE ROAD.

Sir,—In reply to "Disgusted" I must say that my experience of courtesy among motor cyclists on the road is quite the reverse to his.

Quite recently I was travelling to Maidstone when I passed a "very amateur" motor cyclist, who was tinkering with his engine, and evidently knew nothing whatever about it. He had taken out the plugs and removed the carburetter, and on my stopping to inquire his trouble, he was unable to tell me. I looked round the machine and found his needle valve was missing, and on telling him this he remembered having taken the carburetter off some hundred yards or so further along the road, and must have forgotten to replace it; we were, however, unable to find it.



Using part of a spoke to repair a carburetter. (See letter, J. G. Clemetson.)

After some consideration, I asked him if he would object to my removing one of his spokes. This I did, and using the nipple as the seating, and cutting the spoke off at the height gauged by the petrol level, I fitted a small nut to the spoke and burred it over to prevent it slipping through the float (see illustration).

This was quite effective, and the owner of the cycle asked for my address, which I gave him. A few days later a small parcel arrived containing a couple of new plugs and a letter thanking me for my trouble and also for a very useful "tip."

J. G. CLEMETSON.

BOOKS AND MAPS FOR MOTOR CYCLISTS

Issued in conjunction with *The Motor Cycle*.

	Price net.	By post.
"MOTOR CYCLES AND HOW TO MANAGE THEM." The standard handbook on the motor cycle. Covers every subject relating to all types of motor cycles, their management and care. Twenty-first Edition. Just published	2/6	2/10
"HINTS AND TIPS FOR MOTOR CYCLISTS." Containing over 400 useful "wrinkles" and helpful hints in regard to motor cycles. Seventh Edition.	2/-	2/3
"TRACING MOTOR CYCLE TROUBLES." A reliable system for tracing motor cycle faults and of remedying any trouble when found. Fourth Edition.	2/-	2/3
"THE MOTOR CYCLE" ROAD MAPS England and Wales, Scotland, London (showing roads into and out of London and avoiding London). Mounted on linen. Set of three, complete in case.	5/6	5/10
"THE MOTOR CYCLE" ROUTE BOOK. With 32 pages of Road Maps of England and Wales, Scotland, and the London District. New Edition. Just published	5/-	5/4

Obtainable by post (remittance with order) from ILIFFE & SONS Ltd., 20, Tudor Street, London, E.C.4, or of leading Booksellers and Railway Bookstalls.

QUESTIONS AND REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not **must be accompanied by a 2d. stamped addressed envelope for reply.** Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Converting a Three-wheeler.

I have a number of commercial Auto-Carriers in use, and consequently know the capabilities of these little machines, and it has occurred to me that a decent pleasure car could be made up of one of these. Could you advise me if it is practicable, and where I could get the necessary bodywork, dummy radiator, etc.? I have particularly in mind an 8 h.p. 1916 model.—H.W.

There is no reason why you should not make quite a satisfactory pleasure vehicle based on an A.C. chassis. The necessary alterations, however, will have to be done locally, as we do not know of anyone who can supply you with the parts you specify. At various times we have seen conversions such as you suggest, and when equipped with bonnet and dummy radiator the appearance is quite good.

Badly Fitted Bearings.

Recently I returned my 1919 2½ h.p. two-stroke to the agents from whom I bought the machine, and they have replaced the white metal big-end and main bearings with phosphor bronze. I removed the cylinder to locate an engine noise, and I find the connecting rod fouls, with its forward edge, the aluminium of the crank case each time piston descends. The new big end has up and down play, and new main bearings are also slack. I have only ridden machine fifty miles since rebushing. (1.) Will you please tell me if the repairers are responsible for this occurring and the reason for it? Can the fault easily be corrected? (2.) Is not this very bad work, and combined with No. 1 responsible for a great lack of power, as timing and carburation are right?—W.H.S.

If the connecting rod fouls the crank case, as you state, it would point to the fact that there has been some very bad fitting, as in order for this to happen the bush must be eccentric in the big end of the connecting rod; that is, provided the original parts have been refitted. The wear seems to indicate that either grossly unsuitable material for the new parts has been used, or that the workmanship is very bad. We presume that you have given the engine ample oil. Without actual examination it is impossible to state whether the repairers are responsible, and we would suggest that you take the machine to them and point out what has happened, and at the same time ask for an explanation.

Overheats after Overhaul.

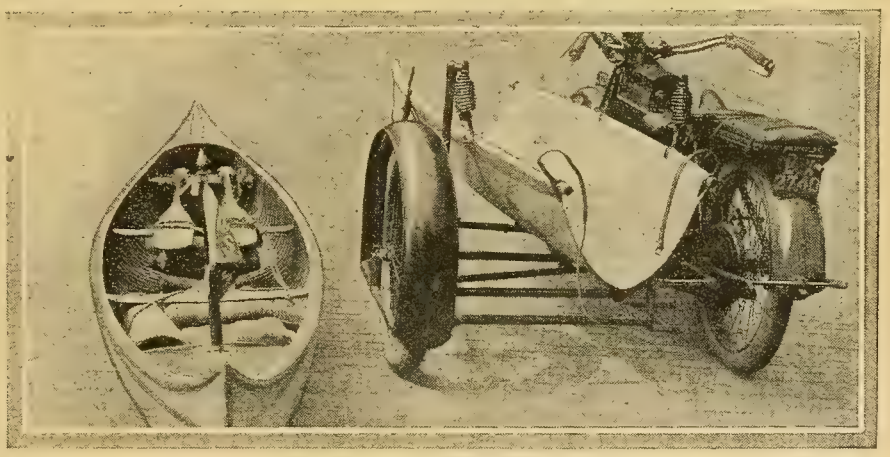
Could you enlighten me on the following? I have had the cylinder of my P. and M. motor cycle at the makers to be reground, valve seatings refaced, with new piston, new valves, and valve guides. I have assembled them, and I find that the engine overheats badly. I have timed it as follows: Piston on top, exhaust valve just closed, inlet just to open, and it blows back just a little through the carburetter; if I advance the inlet one tooth the engine won't run. It has to be cooled down every three or four miles. —H.W.

Try the effect of retarding the exhaust valve one tooth, so that it does not close until the piston has reached top dead centre. It may even be allowed to remain open until the piston has passed the top dead centre position, while the inlet valve should open at the same time, or it may commence to open as the exhaust valve is just about to close. The ignition should be set so that the spark occurs when the piston is on top dead centre, the control being two-thirds retarded.

Intermittent Slowing Down.

A week ago I took off the cylinder of my 1911 Triumph (which has been running well), and also dismantled the timing gear. These I replaced in their right position and gave the machine a trial. Now, when I am going down hill after two or three miles run, a clatter sets up in the engine every few yards and the machine slows up. But if I lift the exhaust lever slightly the machine runs quite all right. Of course, more slowly. And again, if I let the machine out on the level or up hill it goes well for about 100 yards, then drags for a yard or two, and rushes off again. I took the cylinder off and gears out, thinking perhaps one of the bearings had worn, but everything seemed right, but on replacing them and giving the machine another trial the same trouble occurs.—H.B.

The symptoms you describe would lead us to suspect a fault in the petrol supply. Possibly the petrol pipe is blocked up, or there may be an air lock in the petrol tank. The clatter you mention is difficult to account for, but it may be due to starvation.



A REAL BOAT BODY.

Considerable interest was aroused in London streets recently when Mr. Armstrong, of Messrs. Ballard's Motors, 92, Gloucester Road, London, S.W.7, drove this outfit with the canoe up to the City. One would imagine that such a lengthy body as the Canadian canoe entails—15ft. long—would render the machine extremely unwieldy in traffic, but this is not the case, as Mr. Armstrong turned the machine round in Tudor Street with the greatest ease, and after a short trial run, brought it up alongside the pavement without overlapping it in the slightest. The beauty of the means of carrying the canoe is that it can be detached in about thirty seconds. It is held in a Willesden canvas "hammock," and is secured by straps fore and aft, while amidships is a steel rod with a lever screw which keeps the canoe securely in place.

Side Play in Gearshaft.

Recently I had chain cases off my 2¾ h.p. Sunbeam, and noticed the sprocket wheel of gear box (although tight on shaft) had about ⅛in. play, viz., the wheel and shaft could be moved in and out of box. Please tell me what to do with this? Will it make chain run off sprocket wheel?—J.G.

Apparently the movement is confined to side play, which is quite in order, and will have no ill-effect on the running. We do not think you need have any fear that the symptoms you describe will cause your chain to run off the sprocket wheel.

Another Mysterious Noise.

I have a 1919 3½ h.p. Ariel, which has run about 6,000 miles. It has lately developed a grind, which appears to come from the crank case. The engine has been dismantled entirely, but no fault whatever can be found. The gear box is also found to be in perfect condition. Can you advise me what is the best course to adopt in discovering this "grind"? The machine will only touch 35 m.p.h.—O.W.

Without examination we are unable to tell you the source of the noise, which appears to come from the engine, especially as you tell us, after dismantling, both engine and gear box appear to be in perfect condition. The speed of the machine is certainly not good, but you must recollect that this particular model has been developed rather as a touring sidecar machine than a high speed solo mount. Possibly you could improve its pace by advancing the ignition somewhat.

Lightening Pistons.

I have a 1914 6 h.p. N.S.U., and I want to increase the speed. The pistons with gudgeon and rings weigh 1 lb. 10 oz. each. Please let me know: (1.) Is this excessive? (2.) What should they weigh? (3.) Where can I get light cast iron ones? (4.) Where can I get light steel ones? (5.) Approximate price? (6.) How to rebalance flywheels?—R.G.K.

(1.) The weight of the pistons is certainly rather heavy, but it may not be possible to lighten them without affecting their strength, and without having them before us we cannot give you any definite information on the point. (2.) It is all a question of design. In all probability correctly designed pistons can be brought down to 16 or 18 ounces. (3 and 4.) You will find it extremely difficult to obtain pistons at the present moment, although if you peruse the miscellaneous advertisement columns of *The Motor Cycle* you might get in touch with a repairer who would undertake to make some for you. (5.) We cannot give you the price. (6.) In a V twin engine it is usual to balance half the weight of the reciprocating masses plus the weight of the rotating masses. The reciprocating parts are the pistons, gudgeon pins, and top halves of the connecting rods, while the rotating parts are the lower halves of the connecting rods together with the crank pin.

Bad Pick Up.

Having purchased a new machine with 4 h.p. Blackburne engine, with Amac single-lever carburetter, I find that, at whatever speed I am running, an opening of the throttle causes a momentary pause, and then the engine goes on all right. The same applies to any size jet. I am using No. 25 at present. What is the correct size jet for solo work, and what setting for the air intake? I find the latter can be set at 0 or 6 without any great difference. Two motor mechanics have overhauled and experimented, but without success. Apart from this trouble, the machine runs perfectly, and everything seems in order.—R.J.P.

A 25 jet should be about the right size for the engine you are using, but since you are able to use either 0 or 6 holes of extra air without apparent effect, we gather that the choke is too small, and should recommend you to write to the manufacturers of the carburetter, who will no doubt give you the requisite information.

IMPORTANT DATES.

Mon., Aug 23rd, to Sat., Aug. 28th—
A.C.U. Six Days Trial. Darlington as a centre.

Sat., Sept. 4th—
Scottish Speed Championships at St. Andrews.

Scott Trial in Yorkshire.

Sat., Sept. 25th—
East Midland Open Reliability Trial, organised by the Wolverhampton, Redditch, and Kidderminster M.C. Clubs.

Sat., Oct. 9th—
M.C. and A.C. Open Reliability Trial.

Nov. 29th-Dec. 4th—
Olympia Motor Cycle Show.

READER'S REPLY.

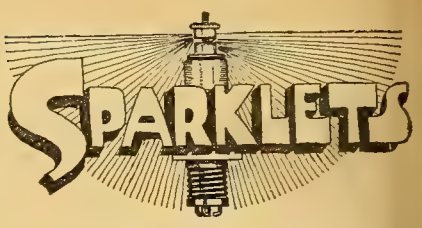
Mysterious Lack of Power.

Seeing "P.E.T.'s" query in your issue of the 12th inst., I feel I would like to give him some information regarding his trouble with the 2½ h.p. J.A.P. engine. I had precisely the same difficulty with my 4 h.p. J.A.P.; additional troubles were high petrol consumption and frequent breakage of exhaust valves. As you suggest, I kept the tappets properly adjusted and tried all kinds of pet timings both for ignition and valve gear, but met with no success. I then dismantled the engine with a very determined spirit to run the trouble to earth and spent pounds in special valves, etc. The engine was apparently in perfect mechanical order throughout, but the cam and rockers were badly worn, and when I had these replaced I was immediately rewarded by the engine developing its full power and giving 120 miles per gallon.—B. KENT.

RECOMMENDED ROUTE.

STAINES TO ILFRACOMBE.—A.S.

Staines, Bagshot, Blackwater, Hartley Row, Basingstoke, Whitchurch, Andover, Amesbury, Heytesbury, Warminster, Frome, Shepton Mallet, Glastonbury, Bridgwater, Taunton, Milverton, Wivelscombe, Bampton, South Molton, Barnstaple, Ilfracombe.



The Winning T.T. Machine.

Leicestershire readers will be interested to know that the Sunbeam which won the Senior T.T. race will be on view at the Sunbeam Depot, 16, London Road, Leicester, during the present week.

The Stocktaking Period.

The Triumph Cycle Company, Coventry, ask us to notify our readers, and particularly Triumph riders, that their works will be closed from August 26th to September 6th for annual stocktaking and rearrangement of plant.

Motor Cycles for Hire.

In view of the numerous enquiries we are receiving asking where motor cycles may be hired, North-country readers will be interested to learn that the Northern Motor Exchange, Marion Street, Sunderland, have a number of 2¾ h.p. Douglas motor cycles, which they are prepared to let out on hire.

Patronised by Royalty.

H.R.H. Prince Henry uses both a solo and a sidecar machine; moreover, he appreciates that a good machine deserves to be well cared for. He has recently purchased for both his mounts Howard covers, which are made by the Howard Car and Cycle Cover Co., 71, High Holborn, W.C.1.

Plug Testing Free.

A sparking plug testing apparatus has recently been installed at the London depot of the Apollo Plug Co., 84a, Great Titchfield Street, W.1. It is capable of testing any type of plug, a voltage of 250,000 (under a pressure of anything up to 250 lb. per square inch) being passed through the plug. Motorists can avail themselves of this apparatus free of charge.

Units and Odds and Ends.

Enthusiastic amateurs are again turning their attention to cycle car construction in their spare time. One firm, the Service Co., 289-293, High Holborn, W.C., is laying itself out to supply materials, such as engines, gear boxes, frame parts, etc. The firm also keeps in stock a large selection of second-hand motor cycle parts.

Catalogues Received.

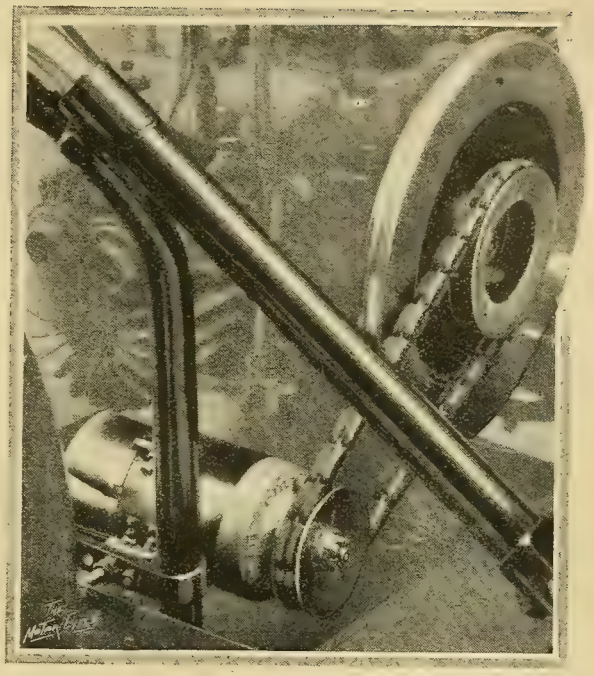
We are in receipt of a copy of the miniature edition of Messrs. Brown Brothers' 1920 catalogue. This contains the same complete information of the goods marketed by this firm as the ordinary catalogue, but should prove exceedingly useful for ready reference.

The Service Company, Ltd., 228-293, High Holborn, London, W.C.1, have sent us a copy of their latest catalogue of accessories interesting to motor cyclists and light car owners. This contains a very attractive list of accessories.

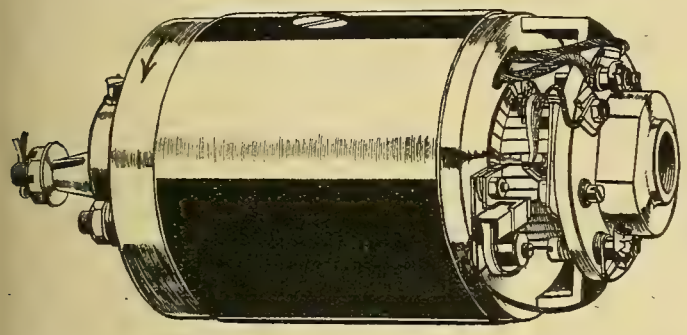
The Rotax Motor Cycle Lighting Outfit.

A Variable Speed Dynamo of Compact Design for Use on Solo Machines or Sidecars.

IT is with great pleasure that we are able to announce that the Rotax motor cycle electric lighting outfit is now ready for the market. We have known for a considerable time that this well-known electrical firm had at last turned its attention to adapting this equipment for use on solo motor cycles and sidecar outfits. Not only in connection with motor car installations is the house of Rotax famous, but the system used by them—Leitner's—is also employed for the illumination of trains, not only in this country, but all over the world. This variable speed dynamo is provided with three brushes, and is shunt wound with the winding across the positive and demagnetising brushes. Each dynamo is capable of adjustment by the makers, and is so set by them that it gives the maximum charging output of five amperes. The Rotax is a six volt set, extremely neat and compact in design, weighs only 6¼ lb., and occupies but little space on the machine to which it is fitted.



The Rotax dynamo, driven off an auxiliary pulley fixed to the flywheel on a Douglas. The switch box is situated on the top of the tank.



Dynamo with commutator cover removed, showing brush gear.

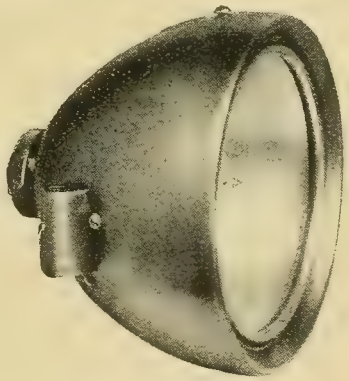
The switchboard is designed so that it can be fixed into the side of the tank, or placed on the top of it, or on the top tube. It is fitted in the last mentioned position on the 4 h.p. Douglas sidecar outfit. Simplicity is the keynote of its construction. On the box is a pointer operating a barrel switch, which has three positions, (1) for lighting the lamps, (2) for charging, and (3) "off." At the top of the switchbox is a small slot through which a white mark appears. When the engine is running and the pointer is moved to the word "charge" or "lamps," a red mark appears in the orifice, thus denoting that the battery is charging. This red mark is situated on the top of the cut-out switch, and indicates that the switch has cut in and the dynamo is charging.

The Rotax tail lamp.

Holes for the leads in the switchbox cover are at an angle so that wet is excluded. A suitable box is supplied for the battery. The dynamo in this case is provided with a pulley, and is driven by means of a Whittle belt with an extra pulley bolted on to the Douglas flywheel, while the instrument is held in a strap clip situated at the bottom of the duplex down tube of the Douglas frame.

Numbered Terminals.

All terminals are numbered, so that installation should be quite easy. The set illustrated has been under test for a long time, and the Rotax Motor Accessories Co., Ltd., Rotax Works, Willesden Junction, London, N.W.10, knowing the reputation they enjoy with their car lighting outfits, have not placed it on the market before it has been thoroughly proved.



The Rotax head light

Much care and attention have been bestowed upon the design of the lamps, which are both neat and efficient. The head lamp has a smooth exterior which is easily cleaned, and a large knurled nut is provided for adjusting the focus of the bulb.

25,000 Miles per Day for a Year.

Misprints and a few ciphers are responsible for strange news in the daily papers. 2,000,000 miles on a set of tyres which still look new is one of the latest.

182 Government Motor Cycles Missing.

The third report of the Public Accounts Committee mentions that, of the 351 motor cycles issued to the Ministry of Food during the railway strike, only 169 have as yet been returned to Slough. The matter is being further investigated.

Where the A.C.U. Competitors are To-day.

To-day (Thursday) competitors in the A.C.U. Six Days Trials will start from Darlington (Bond Gate) at 8 a.m. on the fourth day of their strenuous ride. The times of the first man at the various places *en route* are as follows: Staindrop, 8.33 a.m.; Egglestone, 9.3; Mickleton, 9.10½; Brough, 9.54½; Kirkby Stephen, 10.7½; Soulby, 10.15; Crosby Ravensworth, 10.51; Shap, 11.3; Clifton, 11.27; Penrith, 11.36.

In the afternoon they will commence to leave Penrith at one o'clock, and the first competitor is due at Langworthy at 1.14½; Melmerby, 1.27; Alston, 1.58½; Neuthend, 2.13; West Gate, 2.52½; Bolt's Burn, 3.7½; Wolsingham, 4.13; Tow Law, 4.23½; Crook, 4.37; Bishop Auckland, 4.53½; Darlington, 5.36.

Where the Competitors go To-morrow (Friday).

MORNING.—Darlington (Skinner Gate), 8.0; Barton, 8.17½; Catterick Bridge, 8.37½; Hunton, 8.57; Middleham, 9.17½; Carlton, 9.31½; Kettlewell, 10.3; Threshfield, 10.21½; Bolton Abbey, 10.50½ Ilkley, 11.7½; Brighouse, 12.9; Huddersfield, 12.22½. (1h. 7½m. lunch stop.)

AFTERNOON.—Huddersfield, 1.30; Glossop, 2.28½; Buxton, 3.11½; Ashbourne, 4.13; Sudbury, 4.43; Yoxall, 5.10; Lichfield, 5.30; Coleshill, 6.16; Stonebridge, 6.28½; Kenilworth, 6.55½; Warwick and Leamington, 7.9.

Saturday's Timetable.

Coleshill, 8.0 a.m.; Stonebridge, 8.12; Kenilworth, 8.39; Warwick and Leamington, 8.52½; Banbury, 9.52; Oxford, 11.0; Henley-on-Thames, 12.9 p.m.; Maidenhead, 12.35; Windsor, 12.55; Staines, 1.13; Chertsey, 1.22; Brooklands 1.40.

Tanks and their Future.

In view of the number of motor cyclists who have been more or less intimately connected with tanks during the late war, the book entitled "Tanks in the Great War," by Col. J. F. C. Fuller, D.S.O., published by John Murray, may be of interest to our readers. In a review of this work in "The New Witness" (edited by G. K. Chesterton), of August 6th, are some interesting facts relative to the Army prejudice against this new weapon. Many people, including some of the German high officials, consider that the tanks were largely instrumental in winning the war, but, in spite of this, it is pointed out that some of the regular army, and especially the cavalry element, who have a large voice in control, are apparently endeavouring to oust tanks from the prominent position which they have won for themselves.

An Ex-Despatch Riders' Rally.

The second annual rally of ex-motor cyclist despatch riders who once formed that section of the late 24th Division took place recently at Knutsford.

On this occasion ten "answered the call," coming by road from distant parts of the country.

Throughout there was shown that fine spirit of *camaraderie* which almost invariably mellows the meetings of ex-service men, and it was unanimously decided to continue the rally as an annual event to take place on the last Saturday in June at somewhere central to all.

Such reunions as this are to be commended, as the interchange of reminiscences, even if often retold, keeps green the friendships struck up during hazardous times.

Special Features.

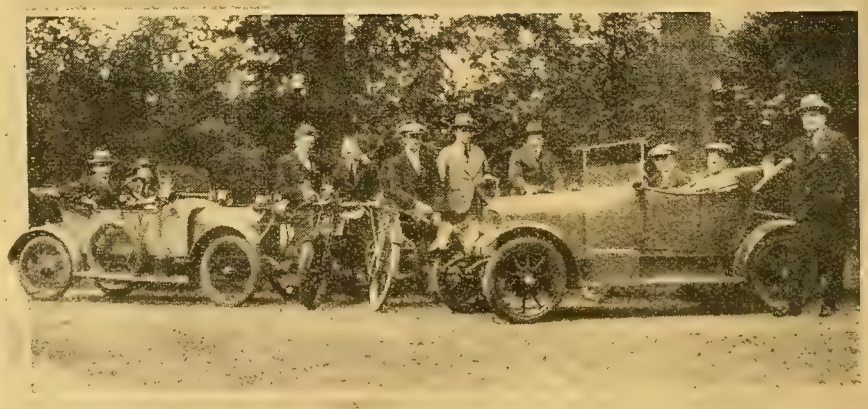
A.C.U. SIX DAYS TRIALS
DAY TRIPS AND WEEK ENDS.
NEW MODELS.

Open Air Camping.

Many motor cyclists are interested in the subject of camping. The current issue of *The Autocar* contains a number of special articles and illustrations dealing with open-air camping in its various phases, including trailer, caravan, and with the aid of an ordinary car loaded with camping equipment. Useful advice of a general nature will be found in the interesting matter which forms the special subject of this particularly attractive number of *The Autocar*.

Hundred Miles at Portmarnock.

The open hundred miles handicap for the cup presented by Mr. W. P. Nash was held at Portmarnock under the auspices of the Dublin and District Motor Cycle Club, and resulted in a win for a Harley-Davidson. Although the preceding days were very calm, the sands were not in the usual good condition, and the times were slow. S. J. Redmond, on a 3½ h.p. overhead valved Indian, was on scratch, but he retired at half distance owing to engine trouble. C. W. Johnson (7-9 Harley-Davidson), with 5m. start, was at the head of affairs at half distance, and, riding out steadily, won easily. The placings were as follows: 1, C. W. Johnson (7-9 Harley-Davidson), 5m.; 2, A. Carton (4 h.p. Indian Scout), 12m.; 3, J. A. Carville (4 h.p. Triumph), 17m. The winner's net time was 2h. 40m. 45s.



Ex-D.R.'s of the late 24th Division on the occasion of a rally recently held at Knutsford, Cheshire.

Midland Open Trial.

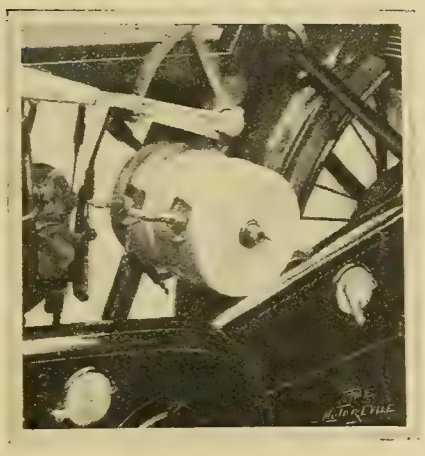
An open trial, which forms one of the seventy events sanctioned by the A.C.U., is to be run off on September 25th, by a joint committee of the Wolverhampton, Kidderminster, and Redditch clubs. The course will be approximately 150 miles. Entrance fees are, for club members 21s. and for trade members £1 10s. Particulars are now available from the hon. secretary, Mr. A. G. Hilton, Hume Street, Kidderminster.

Motor Cycle Works Fire.

An outbreak of fire occurred at the Birmingham works of the James Cycle Co., Ltd., in the early hours of last Sunday morning, and considerable damage was done to the motor cycle assembling sections. The productive side of the works was little affected, however, and only current output is lost; deliveries will only be held up temporarily, and next year's programme is not likely to suffer in any way.

The Autocar Handbook.

The tenth edition of *The Autocar Handbook* will appear next week and will be on sale at all bookstalls, etc. The work had been revised during the war, but the advances made lately have been so great that the book has been rewritten throughout, and is now by far the largest and most up-to-date popular work on the subject. In order to deal with modern developments, the chapters on engines and transmission have each been divided into two, and an entirely new chapter has been added on the electrical installation, which has so increased in importance on modern cars. The special points of the Ford car are also treated in a separate chapter. The whole work has been compiled with great care, each division of the subject having been put in the hands of an expert; and about 250 new illustrations have been prepared. The book is published at 3s. 6d. net, by the proprietors of *The Motor Cycle*, Messrs. Iliffe and Sons, Ltd., 20, Tudor Street, E.C.4.



Two Cearns aluminium spare tube carriers are fitted to H. Mortimer Batten's P. and M. in the Six Days Trials.

Eastern Group Welsh Motor Cycling Clubs.

The following are the results of the open hill-climb held at Govillon Hill on Saturday, August 14th:

CLASS 1: Scooters (open).—1, W. G. S. Hayward (1¾ Whippet), 7m. 39⅘s.; 2, S. R. W. Lincup (1¾ Whippet), 13m. 8⅘s.

CLASS 2: Solo machines up to 350 c.c. (members).—1, Reg. Brown (2¼ Diamond), 4m. 34⅘s.; 2, F. T. Stephens (2¾ Douglas), 5m. 31⅗s.

CLASS 5: Solo machines up to 350 c.c. (open).—1, Geo. Dance (2¾ Sunbeam), 4m. 50⅗s.; 2, N. Mitchell (2¾ Verus), 5m. 32⅘s.

CLASS 6: Solo machines up to 500 c.c. (members).—1, Reg. Brown (3½ Sunbeam), 3m. 55⅘s.; 2, R. E. Toms (3 A.B.C.), 4m. 6⅘s.

CLASS 7: Solo machines up to 500 c.c. (open).—1, Geo. Dance (3½ Sunbeam), 3m. 39⅗s.; 2, C. Sgonina (3½ Norton), 3m. 44⅘s.

CLASS 8: Solo machines up to 750 c.c. (members).—1, C. Sgonina (3½ Norton), 3m. 44⅗s.; 2, Reg. Brown (3½ Sunbeam), 3m. 54⅘s.

CLASS 9: Solo machines up to 750 c.c. (open).—1, Geo. Dance (3½ Sunbeam), 3m. 41⅘s.; 2, C. Sgonina (3½ Norton), 3m. 44s.

CLASS 10: Unlimited solo (members).—1, Reg. Brown (3½ Sunbeam), 3m. 55⅗s.; 2, Alf. Parfitt (6 Sun-Jap), 4m. 13⅘s.

CLASS 11: Unlimited solo (open).—1, C. Sgonina (3½ Norton). 3m. 45s.; 2, G. H. Tucker (3½ Norton), 4m. 15s.

CLASSES 13 AND 14.—Unable to run, due to telegraphic breakdown.

American View of British Motor Cycle Industry.

Returning to the U.S.A. after his trip to this country, Mr. Arthur Davidson, of the Harley-Davidson Co., told an American contemporary that he had acquired an even higher respect than he possessed before for British business methods, sportsmanship, and *savoir faire*. "We Americans ought to forget a lot of that stuff they fed us on in our school-books," he added.

An Outing for Wounded Soldiers.

It would appear that many people are apt to forget that many of our wounded soldiers are still in hospital. In this connection the members of the Surbiton and District M.C. and L.C.C. recently arranged a most successful outing, and conveyed about fifty limbless soldiers for a pleasant trip including tea at Reigate Hill. As we are told that many of the patients have had no such treat for many months we take this opportunity of reminding club secretaries that opportunities of combining a kindness with their own pleasure still exist.

The Number of Motor Bicycles Registered in France

The total number of motor cycles registered in France is 28,538. The Department of the Seine, which comprises Paris, has 7,169 machines; the Department of the Rhône has 1,251; and another Southern Department—Bouches-du-Rhône—has 822. Curiously enough, in some of the Departments which include the greatest number of hills, like the Haute Pyrénees, only sixty-four motor cycles are to be found—while, probably, the smallest number is in Lozère, where there are only twenty-one.

Though the numbers of motor cycles in France are increasing, there seems to be no reason why they should not be considerably augmented, considering the small number there are compared with the population of the country, which is 40,000,000. Probably the bad state of the French main roads is responsible.

A FURTHER DOUGLAS SUCCESS.

IN the report of the B.M.C.R.C. meeting of August 14th, we made mention of a special racing Douglas intended for the Grand Prix Race at Le Mans. On this machine S. L. Bailey was successful on Tuesday, the 17th inst., in beating the flying five miles record. His time was 4m. 32s., equalling 66.18 m.p.h., the previous best being G. E. Stanley, 2¾ h.p. Singer, 75×79 mm., 349 c.c., June 14th, 1913, 4m. 37⅖s., 64.93 m.p.h. Bailey also covered the ten miles standing start in 9m. 16⅗s., at a speed of 64.65 m.p.h., beating the previous record made by Stanley, August 9th, 1913, on a Singer machine, on which he covered the distance in 46m. 58s., at a speed of 63.88 m.p.h.

Hutchinson tyres, an E.I.C. magneto, and Shell motor spirit were used.

Mr. Bailey, who is general manager of the motor cycle departments at the Douglas works, is now on a business visit to his home country, Australia. He sailed on Saturday, and takes a new 2¾ h.p. chain driven model with him.

S. L. Bailey (Douglas), who beat the flying five mile record on the 17th inst. His speed was 66·18 m.p.h. He also lowered the figures for the ten mile standing start.

The worst hill on the first day's run—Park Rash. This hill has a maximum gradient of about 1 in 4 and a very loose surface.

A Review of the Competing Machines. Impressions of the Start.

ALL roads led to Darlington on Saturday, the centre for the 1920 Auto Cycle Union Six Days Reliability Trials. As a matter of fact the majority of those who journeyed up from the Midlands manufacturing districts elected to sample Park Rash Hill, near Kettlewell, one of the most terrifying gradients of the Trial, which had to be ascended on the first day. They experienced varying fortunes, some proclaiming the hill unclimbable with a sidecar—a rash statement, the truth of which was dispelled by several successful ascents late in the afternoon.

Those riders who were not sampling test hills (and, in this connection, it should be stated that a considerable amount of practising has been the rule this year), went to Sutton Bank to see the hill-climb. In Thirsk we saw Mr. and Mrs. J. E. Greenwood aboard a long stroke 4 h.p. Sunbeam sidecar outfit, who were spending a holiday in Yorkshire. The experimental mount they had with them has an engine modelled on the lines of the T.T. engine, *i.e.*, with a detachable cylinder head having vertical radiating fins. At the post office we saw the James team on their way to Darlington. Stobart's sidecar spring had snapped, and a wire was being despatched for a replacement. From Thirsk we rode behind Mr. and Mrs. R. M. Knowles, who are competing on their Scottish Trials Norton machines.

Naturally, the severity of this year's course was the subject of general comment as the riders gathered round the dinner tables on Saturday evening. It goes without saying, too, that "the hills are the roughest and most severe ever known, etcetera." One gets used to this sort of eleventh hour summing up of the Six Days Trials as the years roll round; still, from our knowledge of several of the freak hills included, we are inclined to agree that the whole event will be up to 1921 standard, by which we mean that conditions must necessarily increase in severity as machines are improved year by year. One must remember that Park Rash in the Ilkley Club's trial earlier in the summer stopped four-fifths of the entry, and Yorkshiremen, who *know* what steep and rough hills are, can handle their machines in first-class style. How the motor cycle experts of the whole country will fare is mere speculation at the moment of writing, and the chronicle of their experiences will appear in *The Motor Cycle* next Thursday.

The Eve of the Trial.

Sunday morning last saw competitors putting the finishing touches to their machines in the various garages throughout the town. Between 2 and 3 p.m. each man had to report to the A.C.U. offices and there receive numbers and route cards and book of meal coupons (a reminder of the Dutch Trial), afterwards handing his machine over to the weighbridge officials and then to the official garage for sealing. Each mount had its tank filled before the weighing operations ready for the start at 8 a.m. on the morrow. Two garages have been requisitioned, and in true A.C.U. style the floors are clearly spaced.

Generally speaking, they are a fine lot of workmanlike mounts, which go to form a splendid representation of the various types of motor cycles manufactured today. From lightweights of 275 c.c. the machines range throughout the scale up to luxurious sidecars and runabouts, all of which are bound to be examined with keen interest at Brooklands on Saturday. Judged by numbers, the most popular machine in the Trial is the Rover with ten representatives, Triumphs having nine, Sunbeams eight, and A.J.S. seven. An analysis of the entries is interesting.

Forty different makes are represented by the 133 competitors who started from Darlington last Monday, of which thirty-eight are on passenger machines and ninety-five are riding solo. Twenty-five two-stroke are entered.

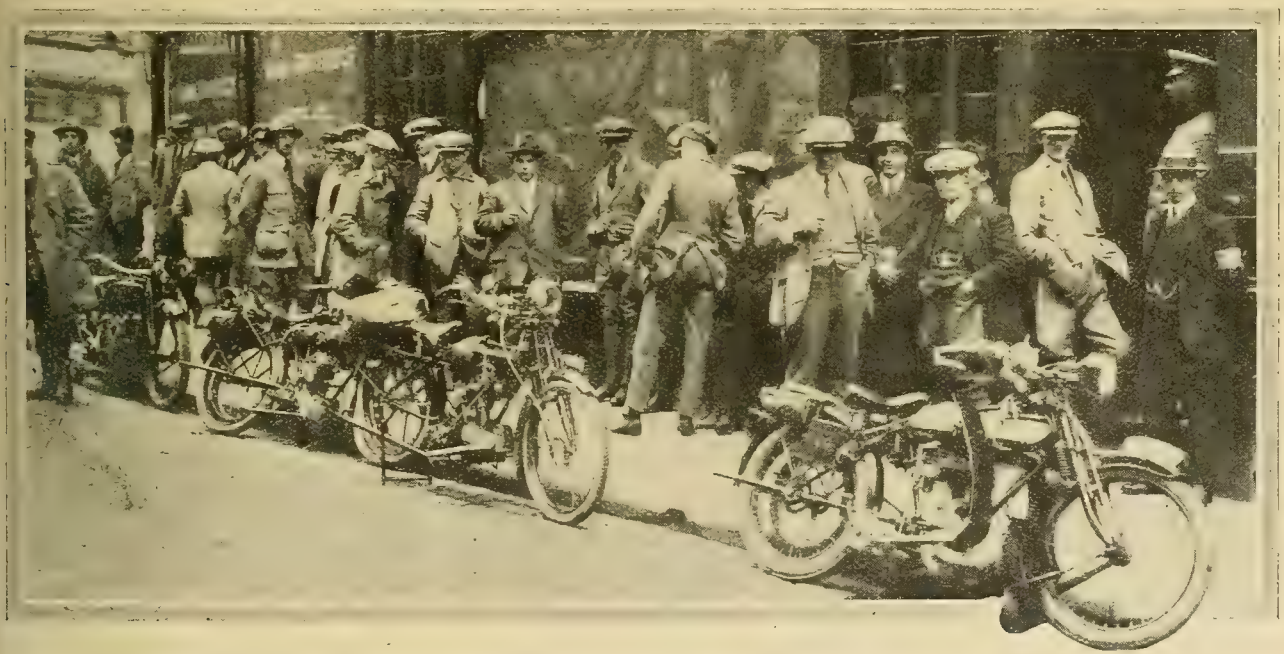
A Review of the Competing Machines.

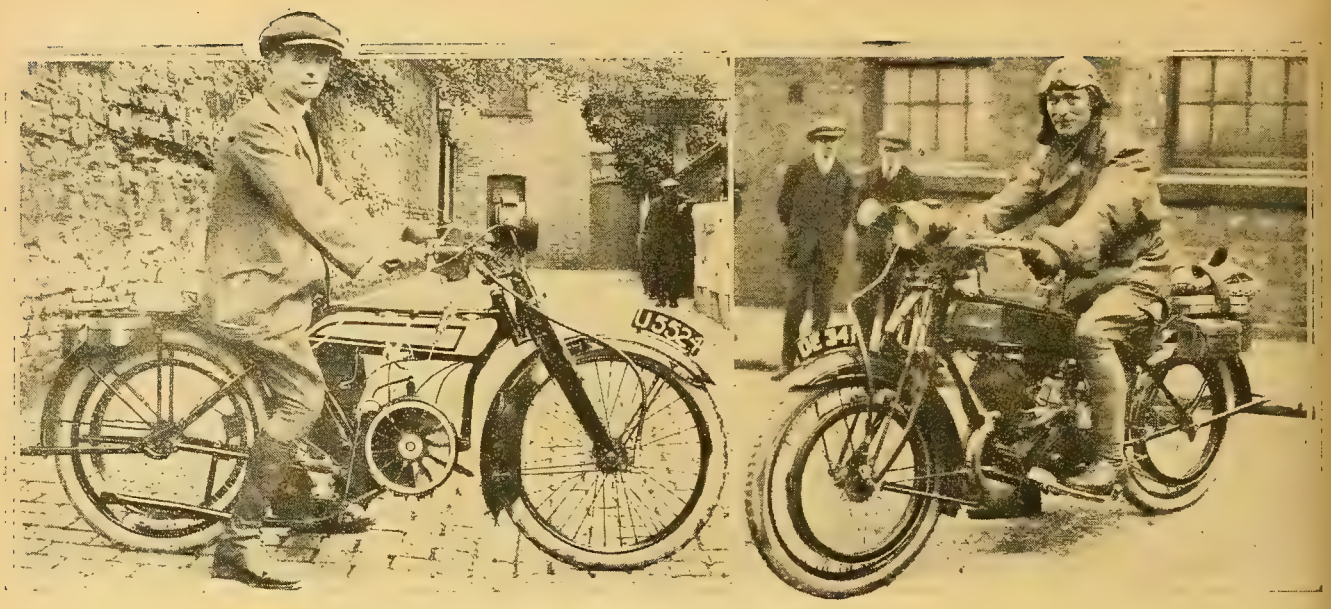
In the main the competing machines are of standard pattern, but here and there one notices new features which usually herald their adoption as standard in the succeeding year. The twin Humber, driven by Sam Wright, for instance, has a sidecar brake consisting of a dummy belt rim of about 12in. diameter and the usual V block, the brake being operated by the passenger. Considering the precipitous and winding descents, this seems a desirable move. Wright's flat twin Humber, by the way, ticks over beautifully quietly, and seems to be quite the most silent machine in the Trial. It has a Cox Atmos carburetter, which instrument is found on a number of machines. The little Velocettes, whose design still arouses feelings of admiration, now have internal expanding front wheel brakes. If the dimensions are large enough, this desirable solo lightweight goes up another stage toward perfection. Alan Hill's Scott has a B. and B. carburetter and twin Splitdorf plugs with spring terminals to each cylinder. Hill assures us that his machine is five miles faster when the plugs fixed in the cylinder head are used. Both mudguarding and silencing have received much attention. Ariels, for instance, have double silencers, and fine mudguards are applied to the Zeniths, one of which has horizontal extensions from the lower stays of the front guard. All the A.J.S. sidecar machines have 700×80 mm. Dunlop Magnum light car tyres. The machines themselves appear to be brand new and well up to the standard of finish attained by this first-class firm. The Sunbeams make a fine show, and have a star team in the saddle whose names have become household words. These solo mounts actually have 700×80 mm. tyres, and, apart from their carburetters, represent standard practice. The carburetters are Amac, B. and B., and Binks respectively. No trial would be complete without a Levis team. The machines have the identical engines used in the Isle of Man. On Park Rash they had plenty of power, but their speed was too high on the atrocious surface, and so, to prevent being buffeted about on the road, the machines were reduced in speed by altering the gear ratios on Sunday to 6.2 and 15.2 to 1. F. W. Applebee (Pa), of course, is astride one of the Levises.

Unquestionably the real novelty of the Trial is the Redrup Radial, of which there are two specimens. One has its engine entirely enclosed; the other is similar to the unit we exclusively described and illustrated in these pages on Feb. 5th, 1920. They run very smoothly, are flexible, and hum like a four-cylinder. If the machines survive the hills and get to Brooklands on Saturday (as we hope and expect they will as an encouragement for the enterprising designer), one can predict quite definitely that they will form a centre of attraction. Lake's A.J.S. has one of the old 2¾ h.p. T.T. engines with a very tall cylinder and side-by-side valves. He found definite traces of water in the tank on Sunday and was

The last stage of the competitors' preliminaries—entering one of the official garages for sealing and storage.



The competitors did not appear to like this, A dull, cold Sunday morning in Darlington had damped the spirits of many, and to stand in a queue to obtain access to the number stewards was far from pleasant.

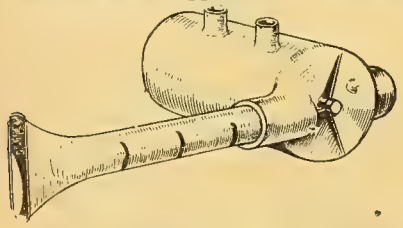


NEW TYPES IN THE TRIAL.

The Redrup three-cylinder radial, a miniature four-stroke of 309 c.c. (the cylinders are hidden by the fan flywheel), and a big single two-stroke. The riders are N. A. Woolley (2¾ Redrup) and Capt. Barton (4½ Dunelt).

busy for some time with the machine upside down. There were several changes in the riders; P. W. Bischoff took Freeman's place on a two-stroke Clyno, and Frank H. Applebee is riding one of the five A.B.C.'s in place of Keith Robinson.

A mount new to competition work is the Ready which has a 2¾ h.p. J.A.P. engine, and is altogether a neat and well proportioned machine. The O.K. two-strokes should do well, for their riders are seasoned competition men, and the machines themselves sound in design and workmanlike in appearance. Incidentally, two are equipped with the 1921 O.K. engine. Enfields have a strong representation, and started off well, for Douglas Alexander had the advantage of acquaintanceship with Park Rash, which he found within his compass provided the left side of the road was hugged tenaciously. The Triumph team this year have solo machines with all chain transmission, the new Triumph three-speed gear boxes and enclosed spring fork. Grinton's flat twin Harley-Davidson looks fit for any task. This rider, by the way, is reported to have seen his machine off by train at Edinburgh, then journeyed to Darlington by road in time to witness the arrival of the train with his trial's mount.

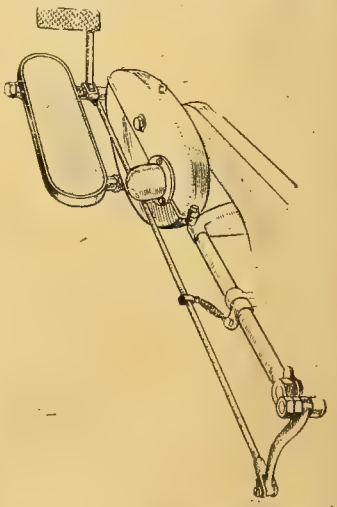


New pattern silencer on the Six Days Rover. The extension pipe is quite short.

Hugh Gibson is riding his Dutch Trials Clyno with a reserve supply of petrol accommodated in a neat flat tin affixed to the carrier. The spring frame sidecar outfit in the hands of A. F. Knight has electrical equipment and combination Avons of 700×80 mm. Beardmore-Precisions look spick and span, their riders being tended by Maurice Holroyd (the son of Mr. Victor Holroyd), who has lately joined Messrs. F. E. Baker, Ltd.

Only two Indians are in the running: a Scout and a 7-9 h.p. Powerplus. One wonders whether the Coventry Victor has sufficient ground clearance for the rough roads in store, but we shall see. The sidecars form an important section, and range from a 400 c.c. A.B.C. to the heavy brigade represented by the Dots and Matchlesses. Whereas the Dots with their red finish are all British, having J.A.P. engines, the Matchlesses have M.A.G. engines and Schebler carburetters. Another departure is the fitting of front wheel contracting band brakes and extra large hubs having ½in. balls. A big two-stroke Dunelt has a sidecar attached, so evidently the makers have great faith in its climbing abilities.

A Matchless modification. Front wheel brakes of the contracting type are fitted to the team from Plumstead.



On the Rover machines several detail improvements are in evidence. Above are shown the rear brake operating rod and crank. The latter is much longer than standard.

Quite one of the most attractive sidecars is Charlesworth's French grey Zenith with disc wheels. Sawer has again set himself the task of piloting a single-cylinder sidecar round the course, and is again astride a 4 h.p. Norton, a make of machine on which he has done so well in the past. The Morgans mostly have J.A.P. water-cooled engines, and appear to be exactly the same designs as have shown up so conspicuously in past events. The Douglas is a notable absentee this year.

Eleventh Hour Impressions of the Trial.

Conjectures as to the Severity of the Course. The Freak Hill Policy.

DARLINGTON. SUNDAY NIGHT.

WE unfortunates who have come up to Darlington by road fully understand why the A.C.U. have come North for its 1920 trials venue. The modern machine is so reliable that no week of ordinary riding can find out its weaknesses. Hence, the tendency in modern trials is to select roads guaranteed to smash up anything, and north of Doncaster heavy industrial traffic has simply knocked the roads to pieces. They are scolloped from side to side into potholes as big as soup tureens, and several competing machines were stalled by the roadside yesterday all the way from Doncaster to Catterick. It is not definitely known how much of this kind of surface is included in the official route, and it must be admitted that the going began to improve north of Boroughbridge. But the Southern entrants had a rare shaking up on their way here, and are saying glumily that the "blinding," previously utilised to make up time after a bad section in the Six Days will be a physical impossibility this year.

Prospects.

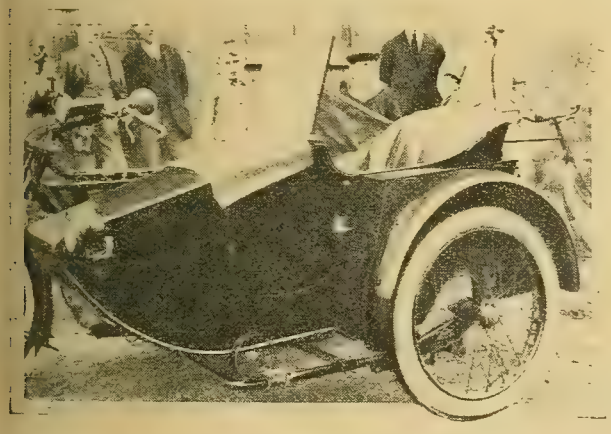
On the eve of a big trial the men always have "wind up" about the hills, but we do not remember ever to have noticed such intense nervousness on the night before any previous event. As usual, there is much circumstantial evidence about the ferocity of the hills. The Rev. E. P. Greenhill fought the Competitions Committee tooth and nail to get Rosedale Abbey Bank excluded, and failed. A Yorkshire enthusiast, who owns a Rolls-Royce, has made umpteen attempts to climb Park Rash, and has given it best in sheer despair. One firm intended to enter a team of single-cylinder sidecars, but after a practice tour elected to send its men round solo. Tim Wood considers that Darnbrook is as near unrideable in wet weather as a hill can be: and there were torrents of rain last night. Hugh Mason says none of these hills compare with the Stake. Thirty or forty men, who went to practise on Park Rash yesterday, turn pale, and hastily order drinks when any local pundit pronounces that Park Rash is a gentle incline by comparison with others which he names. Then some veteran competitor commences to reminisce about the strike over White Shaw Moss in 1913. This is the kind of atmosphere which is always created by the dread of the unknown in a company of keen riders who are anxious to do justice to their machines; and large deductions must always be made for rumour and nerves. Nevertheless, the 1920 trials will unquestionably prove far more severe than any of their predecessors. Indeed, writing before the event has actually started, we think it possible that these trials may at last bring the old "freak hill" policy to a head. If the weather is dry, everything will go off smoothly. If the weather converts arduous stunts into practical impossibilities we may see a radical revision of policy in 1921.

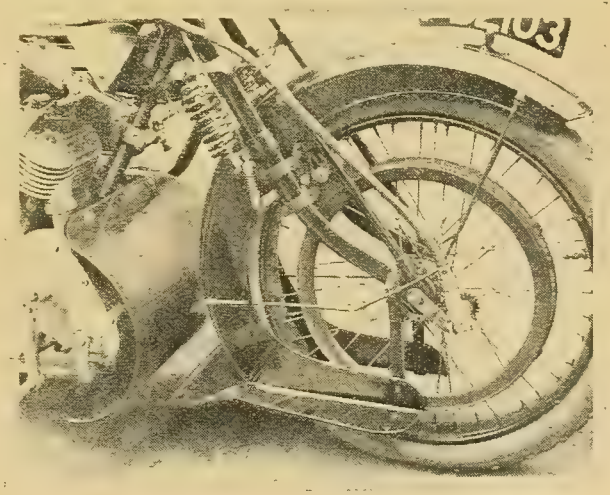
Hugh Gibson and the 2½ Clyno he is piloting. A neat three-quarter gallon tank is strapped to the carrier.

Riding to Time.

As all old competition riders know, there is usually a vast amount of "blinding" in an A.C.U. Six Days. Reliablility marks used to depend on punctual arrival at certain given points. It paid the men to keep well ahead of time in case some rough and dangerous section should have to be taken at a mere crawl. This year a rider's time "may" be taken at *any* point of the 918 mile course. This is roughly equivalent to threatening us with an unlimited number of secret checks over the whole 918 miles of the route. This threat is modified by a printed hint that in practice no timing will be attempted at points where we are likely to have lost time. Still to the general strain of riding must now be added the necessity of being not more than ten minutes late or early *for a whole week*! Every twenty miles from start to finish we shall see a large board by the roadside showing the distance covered since 8 a.m. on Monday: thus somewhere near Buxton on Friday afternoon we shall be greeted by the figures 740, and rejoice that we have only 178 more miles to cover.

The first petty controversy is likely to arise about replenishing tanks. The rules say that this may only be done in controls, *i.e.*, at midday and night. Presumably this regulation is meant to rob riders of plans and excuses for visiting garages and also to enforce capacious tanks. Many of the babies and of the sidecars cannot do anything like one hundred miles on a tank, and something like this distance is set on several half days. So the owners intend to carry reserves with them, and the interpretation of the rule remains to be cleared up later on.





(Left) A large tool locker in the new Enfield sidecars. Observe that the mudguard is fitted to the body.

THE START ON MONDAY.

Competitors were early astir on Monday for the eight o'clock start. They were despatched in pairs by F. T. Bidlake—one solo and one sidecar—until the 120 had departed, after which solo riders went off singly. The weather was dull, but fine, and all except six weighed in. These non-starters were P. H. Hall (4 Blackburne), H. W. Merrill, jun. (3 A.B.C.), R. Locke (3½ Coventry Eagle), M. Davies (3½ Sunbeam), R. H. Bywaters (6 A.J.S. sc.), and W. McClennan (4 Norton sc.).

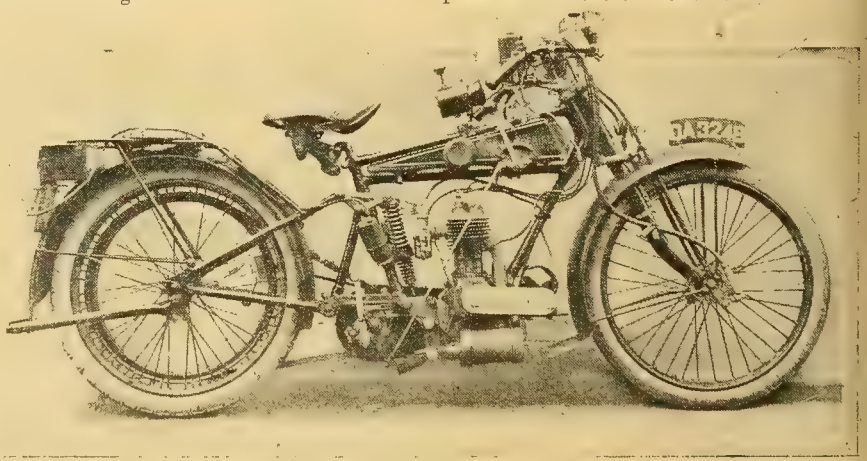
Most of the others made good starts, but one could detect whether they used benzole or petrol, thus despatching the claim that modern benzole is odourless.

J. A. Newman, now mounted on a spring frame 2¾ h.p. New Imperial, started well. Mrs. O. M. Knowles (3½ Norton), the only lady competitor, received a hearty cheer from the spectators. N. A. Woolley (2¾ Redrup Radial) started splendidly, but C. B. Redrup himself stopped his engine on the word to go, as it was misfiring. After cleaning the plug, however, he started well. L. A. Bees, on the Beardmore-Precision, got away impressively. The Enfields are forerunners of the 1921 models, having new rear mudguard and a special shield inside the sidecar wheel. A long tool-box is fitted at the side of the body.

The Dot machines are identical with those used last year.

Several competitors were wearing light-coloured oilskins, which, worn with a belt, stuck out at the skirt like the dress of the ballet girl.

Silencer efficiency varied noticeably. H. E. Ashley (6 L.M.C. sc.) started splendidly. All were expectant of Park Rash, which was bound to weed out many, but the morning's run was mild in comparison with the afternoon section.



J. A. Newman's spring frame New Imperial—a new model which embodies a three-speed gear box.

UP SUTTON BANK IN 1 MIN. 18 SECS.

York and District M.C.C. Open Hill-climb.

SUTTON Bank is one of the famous hills of England, but its location on the Hambleton Hills in North Yorkshire renders it inaccessible to the majority of motor cyclists, to whom, in consequence, it is unfamiliar.

Last Saturday it was the scene of the York and District M.C.C. annual open hill-climb, which attracted 119 entries.

The programme was not without its stars, however, and the spectators at various parts of the course were soon to learn that most of the classes were to be close duels between L. Mitchell (3½ Norton) and G. S. Boston (2¾ A.J.S.).

Boston's first run up was in Class 3 for 350 c.c. solo machines, when he reached the summit in 1m. 37⅖s. But the duel did not really open until Mitchell clipped 8⅘s. off this time in Class 8 (500 c.c.). L. A. Runton (3 A.B.C.) was 9⅕s. slower, but E. Searle (3½ Norton) narrowed the margin to 1⅗s. Then Boston beat Mitchell's time by 4⅘s.

In the following class it was evident that these two riders were using to advantage the experience gained on the previous runs. Mitchell succeeded in bringing the time down to 1m. 22s., which was thought by many to be the fastest time possible for the day. Boston's little A.J.S. was running better than ever, but he failed to do better than 1m. 23⅘s.

In Class 10, Mitchell decreased his time of over 2s., and it was thought that 1m. 20s. was surely the limit. The excitement was great when Boston came hurtling up the winding course, and roared over the summit with ⅖s. to the good, his time being 1m. 19⅗s.

It was now apparent that the heavier weight of the Norton would be in Mitchell's favour if it were possible at all for him to improve upon his time. Boston found it difficult to prevent his machine from skidding under him.

In his final run up (in Class 11), Mitchell succeeded again in lowering his time (1m. 18⅘s.), but Boston's luck was out, and he took 1m. 26⅗s., thus leaving the Norton champion of the day.

Two other Norton riders, E. Searle and G. E. Cowley, came next in order of merit, but Runton's A.B.C. was fast, as was Debenham's Brough. Blackhouse, on a Triumph, also accomplished some good speeds.

On Sutton Bank. A big crowd gathered at the bend, where some good cornering was witnessed.

G. S. Boston (A.J.S.), who has done remarkably well in speed events lately.

Individual Performances.

L. Mitchell (3½ Norton).—Class 8: 1m. 29s. Class 9: 1m. 22s.* Class 10: 1m. 20s. Class 11: 1m. 18⅘s.*

G. S. Boston (2¾ A.J.S.).—Class 3: 1m. 37⅖s.* Class 4 (sidecars): 1m. 46⅘s.* Class 5 (sidecars): 1m. 46⅘s.* Class 6 (sidecars): 1m. 46⅘s.* Class 7 (sidecars): 1m. 46⅘s.* Class 8: 1m. 24⅘s.* Class 9: 1m. 23⅘s. Class 10: 1m. 19⅗s.* Class 11: 1m. 26⅗s.

E. Searle (3½ Norton). Class 8: 1m. 30⅘s. Class 9: 1m. 29⅘s. Class 10: 1m. 31s. Class 11: 1m. 32⅘s.

G. E. Cowley (3½ Norton).—Class 4 (sidecars): 1m. 54⅕s. Class 5 (sidecars): 1m. 54⅘s. Class 6 (sidecars): 1m. 54⅖s. Class 7 (sidecars): 1m. 54⅘s. Class 8: 1m. 33⅘s. Class 9: 1m. 30⅘s. Class 10: 1m. 30⅗s. Class 11: 1m. 31⅕s.

F. W. Dixon (7-9 Harley-Davidson).—Class 7 (sidecars): 1m. 47s. Class 11: 1m. 26⅕s.

L. A. Runton (3 A.B.C.): Class 8: 1m. 38⅗s. Class 9: 1m. 38⅗s. Class 10: 1m. 59⅗s. Class 11: 1m. 58s.

Miss S. F. Wilson (2¼ Velocette).—Class 2: 2m. 44⅘s.* Class 3: 2m. 38⅗s.

R. T. Cawthorne (2½ Autoglider).—Class 1: 2m. 8⅕s.* Class 3: 2m. 9⅘s.

G. Hellewell (3 A.B.C.).—Class 8: 1m. 44⅗s. Class 9: 1m. 46s. Class 10: 1m. 46⅕s. Class 11: 1m. 47⅘s.

W. Wilkinson (4 Triumph).—Class 9: 1m. 49⅕s.

G. A. Reed (3¾ Scott).—Class 9: 2m. 21⅕s. Class 10: 2m. 42⅗s.

T. V. S. Twentyman (3¾ Scott).—Class 10: 1m. 53⅗s.

W. L. Guy (3¾ Scott).—Class 9: 1m. 46⅕s.

S. S. Debenham (3½ Brough).—Class 9: 1m. 35⅗s.

G. Clapham (4 Triumph).—Class 9: 1m. 45⅖s. Class 10: 1m. 45⅖s. Class 11: 1m. 44⅗s.

R. W. Stanfield (3¾ Scott).—Class 9: 1m. 41⅖s.

G. Eastwood (4 Triumph): Class 9: 1m. 51s. Class 10: 2m. 36⅗s. Class 11: 1m. 46s.

G. Thompson (6 Zenith).—Class 11: 1m. 45s.

Geoffery Hill (3¾ Scott).—Class 9: 1m. 38s.

W. Blackhouse (4 Triumph).—Class 9: 1m. 36⅖s. Class 10: 1m. 39⅕s.

R. Flint (3 A.B.C.).—Class 9: 1m. 46s. Class 10: 1m. 41⅕s.

W. H. Hadfield (4 Triumph).—Class 9: 2m. 8s. Class 10: 1m. 47⅕s.

S. R. Whincup (1½ Whippet).—Class 1: 3m. 34s.

H. Clay (Essex).—1m. 58⅖s. Fastest car.

* Winner of class.

L. Mitchell (Norton), who made fastest time of the day.

CLUB NEWS. (Continued from page 245.)

Essex M.C. Twenty-four Hours Trial

Entries for the Essex Motor Club twenty-four hours trial on September 10th and 11th should reach the trials hon. sec., Mr. F. A. Applebee, 208, Great Portland Street, London, W.1, not later than August 28th.

Stockport and District M.C.

It is the intention of the Stockport and District Motor Club to have a closed reliability run on the 29th August, of 100 miles. The Talbot Challenge Cup presented to the club by Messrs. The Talbot Garage, Ltd., is to be presented for the best performance of the day and a matter of a dozen more prizes are offered. For particulars *re* membership and entry forms apply to Trials Hon. Secretary, E. S. Abram, 226, Manchester Road, Stockport.

Bristol M.C.C.

The above club will hold its open hill-climb on Saturday, September 11th. The hill selected is within a twenty miles radius of Bristol, perfectly safe at speed, and has a very excellent surface. Further particulars and entry forms may be obtained either from Mr. A. E. Tozer, Rudge-Whitworth, Ltd., Queen's Road, Bristol, or Mr. H. W. Jacobs, 4, Ravenswood Road, Redland, Bristol. Entries close first post, Saturday, September 4th.

North London M.C.C.

The annual hill-climb was held recently at Handpost Hill, near Northaw, and attracted a large and varied entry. The surface was good, the weather ideal, and the police rendered all assistance in their power to make the event a success. Fastest solo of the day was G. J. Read (6 Enfield), and fastest sidecar R. W. Greaves (7-9 Indian sc.) A. A. Prestwich (2¾ Diamond) made a fine ascent in the 350 c.c. class.

Glengarriff and Back Awards.

The following are the awards in the two days trial of the Dublin Club to Glengarriff and back :

Gold Medals: P. H. Hurse (4¼ B.S.A.), Jas. Browne (2¾ Douglas), H. McAllister (6 A.J.S. sc.), T. E. Greene (3½ Douglas), A. Carton (4 Indian), J. McEntaggart (7-9 Indian), D. Allen (4 Norton), and Hon. H. Massy (7 Harley sc.).

Silver Medal: J. Doyle (3 A.B.C.)

Bronze Medals: R. Humphreys (2¼ Velocette), J. A. Adair (4¼ B.S.A. sc.), and P. McGrath (2¼ Velocette).

N. Lepler was disqualified for repairs in Maryborough control.

Roche Cup: Best performance, P. H. Hurse (4¼ B.S.A.)

Unlimited Sidecar Prize: Hon. H. Massy (7-9 Harley-Davidson).

Under 600 c.c. Sidecar Prize: J. Adair (4¼ B.S.A.)

Lightweight Prize: R. Humphreys (2¼ Velocette) and P. McGrath (2¼ Velocette).

Team Prize: J. Browne (2¾ Douglas), T. E. Greene (3½ Douglas), and P. H. Hurse (4¼ B.S.A.)

Newcastle and District. M.C.

The Newcastle and District Motor Club's Travers reliability trial on 15th August, over a 120 miles course, which included some of the freak hills to be found in the County of Durham, comprised nine checks and five observed hills.

Competitors were allowed one minute late or early at each control without deduction of marks. There were forty-six competitors. A flexibility and acceleration test was included near Edmundbyers.

Mr. W. Crompton worked out the formula results, whilst Mr. W. Baxter was chiefly responsible for scrutinising the various reports. Mr. Linden Travers was present at the adjudication in an advisory capacity.

Messrs. Travers provided £50 for prizes, and the club undertook to present gold medals for the best performance by a novice in each class. The results were as follow :

Under 350 c.c. Class (solo).—1, £7. R. W. Lawton (2¾ Douglas); 2, £3, J. E. Reed (2½ Wolf); novice gold medal, W. Rickard (2¼ Diamond-Jap).

Under 600 c.c. Class (solo).—1, £7, R. Reid (4¼ B.S.A.); 2, £3, A. Dixon (3½ Rover); Mr. Dixon also took the novice gold medal.

Under 600 c.c. and Sidecar.—1, £7, C. Armstrong (3 A.B.C.); 2, £3, W. Crompton (4 Triumph).

Sidecar Class (any capacity).—1, £7, J. Cooper (6 A.J.S.); 2, £3, O. Birse (8 Rex-Blackburne); novice gold medal, R. Astbury (8 Chater-Lea).

Car Class (any capacity).—1, £7, R. Seed (16.9 Arrol-Johnston); 2, £3, A. G. Wood, D.S.O., M.C. (10 Le Zebre); Mr. Seed also secured the novice gold medal.

Plymouth and District M.C. and L.C.C.

A hill-climb will be held at Huckaby for a cup, presented by Major Moon, on September 11th, also a reliability trial on September 25th for a prize given by Sir Thomas Baker.

Liverpool M.C. Open Trial.

A sporting one day trial which usually includes some of the worst hills in North Wales is the competition for the Reliance cup, organised annually by the club.

This year the trial is to take place on September 18th, and Wales will again be the objective. Entry forms and full particulars can be obtained from the hon. sec., Mr. E. E. Holloway, 36, Sandown Lane, Wavertree, Liverpool.

Hull Clubs' Joint Outing.

A most enjoyable afternoon was spent last week-end by members of the Hull Motor Cycle and the Hull Auto Cycle and Light Car Clubs, when the vice-president of the latter, Major A J. Atkinson, entertained both clubs at his residence, Elloughton Dale, on Saturday last. Before tea a gymkhana was held and five out of the eighteen events decided. The winners of these were :

Colour race, Mr. Griffin; cigarette race, Mr. Walker; obstacle race, Mr. Walker; potato race, Mr. Struthers; riding the plank, Mr. Dodsworth.

Owing to the wet weather after tea, it was decided to continue the sports next Saturday at 3 p.m. in the same field, again kindly lent by Major Atkinson.

Open Welsh Speed Championships.

A Well-organised Programme carried out on a Perfectly Natural Speedway.

ASSISTED by the officials of the Carmarthen and the Neath and Ystalyfera Clubs the open Welsh speed championships were decided on the 19th inst. The organisation of the event was excellent, the entire programme being run off under three hours without a hitch. Many and varied styles of cornering were witnessed : some good and some indifferent. Great fears were entertained by the crowds for the safety of one rider, who proceeded steadily seaward for some distance. It was thought he had heard the call of the sea; however, he changed his mind ultimately, to the relief of all.

Pendine Sands form the finest natural speedway imaginable, inasmuch as a machine can be steered "hands off" on them, and there are few places of which this can be said. The results given below are subject to confirmation by the executive committee.

OPEN CHAMPIONSHIPS.

CLASS 1 : 300 c.c., four miles (two laps).—1, W. Edwards (Omega); 2, T. Hopkins (Edmund); 3, Morris Isaac (Edmund). Time : 6m. 45s.

CLASS 2 : Ten miles (five laps).—1, George Dance (2¾ Sunbeam); 2, Howard Davies (2¾ A.J.S.); 3, W. Edwards (2¾ Verus). Time : 12m. 15s.

CLASS 3 : 500 c.c., ten miles (five laps).—1, George Dance (3½ Sunbeam); 2, C. Sgonina (3½ o.h.v. Norton); 3, Howard R. Davies (2¾ A.J.S.). Time : 11m. 23⅘s.

R. C. Toms, on his A.B.C., had engine trouble, and Lindsay (Norton) failed to start owing to another machine falling on his machine and breaking off the vulcanite magneto high-tension terminal. Sgonina and Dance had a good tussle, Dance ultimately winning comfortably.

CLASS 4 : Unlimited solo, ten miles (five laps).—1, George Dance (3½ Sunbeam); 2, A. Lindsay (3½ Norton); 3, C. Sgonina (3½ o.h.v. Norton).

A good tussle. Dance's acceleration after cornering won him victory. The first three machines came home within twenty seconds of one another. G. Dance, 10m. 38⅖s.; A. Lindsay, 10m. 45⅖s.; C. Sgonini, 10m. 53s.

WELSH CLOSED SPEED CHAMPIONSHIPS.

CLASS 5 : 300 c.c., four miles (two laps).—1, Morris Isaac (Edmund); 2, T. Hopkins (Edmund). Time : 6m. 44⅘s.

CLASS 6 : 350 c.c., four miles.—1, S. Jones (2¾ Verus); 2, S. Pitman (2¾ Douglas). Time : 6m. 8⅘s.

W. Edwards (2¾ Verus) blew a cylinder head in pieces when leading well ahead.

CLASS 7 : 500 c.c., four miles (two laps).—1, A. Lindsay (3½ Norton), 4m. 15s.; 2, C. Sgonina (3½ Norton), 4m. 27⅘s.; 3, J. Thomas (3½ Norton), 4m. 35s.

CLASS 8 : Unlimited, four miles (two laps).—1, A. Lindsay (3½ Norton), 4m. 15⅘s.; 2, C. Sgonina (3½ Norton), 4m. 20⅘s.; 3, R. E. Toms (3 A.B.C.); 4, J. Thomas (3½ Norton); 5, J. O. Smith (4 Norton).

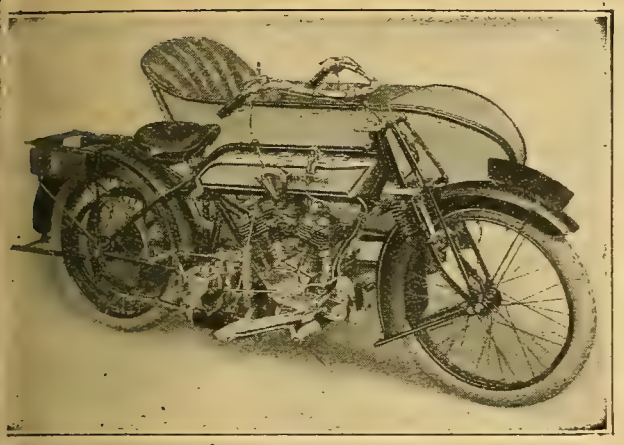
Class 8 had the best entry, attracting sixteen entries, of whom four or five failed to materialise. None of the big twin enthusiasts got up very much speed.

CLASS 9 : Sidecars, 750 c.c., straight mile.—1, Handel Davies (5-6 James); 2, Jack Thomas (3½ Norton).

CLASS 10 : Sidecars, 1,000 c.c., straight mile.—1, E. R. Mitchell (7-9 Indian); 2, Handel Davies (5-6 James); 3, Jack Thomas (3½ Norton); 4, A. King Smith (8 Harley-Davidson).

George Dance takes three open championships, and A. Lindsay two closed championships and the Triumph Co.'s silver cup for best performance by a Welsh competitor.

Howard Davies (A.J.S.), whilst fast, did not seem up to recent form.



"Look for the Big 'H' always in the front."

The "no-trouble" Combination

¶ THE owner of a Hazlewood Combination commences his tour with the confidence born of experience resulting from long and satisfying service.

It will take you anywhere over the worst roads to be found at home or abroad, and *will bring you back.* You can depend upon the "Big H" with its famous J.A.P. Engine to do more than is asked of it.

Remember its past record of remarkable successes, and you understand why it is called the "no trouble" combination.

Let YOUR next combination be a

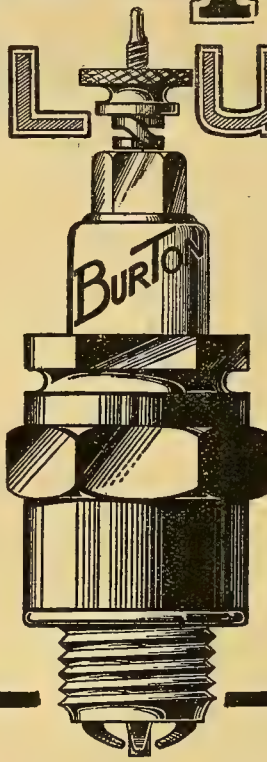
THE BURTON PLUG



5/- 5/-

The plug that recommends itself

Extract from "The Motor Cycle," June 17th, 1920.

PLUG EFFICIENCY.

SIR,

I give the following experience, which occurred some little time ago. On a fairly new two-stroke engine the plug suddenly went wrong after previously doing quite well. I tried five different plugs of the best known makes, and none lasted more than ten minutes. I then asked the garage people if they could suggest anything, and was advised to try a Burton, which was unknown to me. I never had another moment's trouble. I know nothing else whatever about it, not even the makers' name or address, but wish to give credit where it is due.

Apply for particulars—

SALES MANAGER,

Progress Works, Bernard St., WALSALL.

Not a single rider

can feel safe on any motor cycle if he has to keep turning to look back. If only nature had endowed us with two sets of eyes all would be well, as it is—mechanical aids must be used.
The "Clayrite" No. 10 mirror, a really high-class article, provides an eye for the rider's blind side, allowing him to keep his eyes on the road ahead, yet at the same time being able to discern all movement to the rear. In traffic, "Clayrite" mirrors prevent many an accident. Ask your dealer about it, and if he cannot supply, send us his name. We will do the rest.

THE AUTOMOBILE ENGINEER YEAR BOOK *for* 1920

220 Pages. Cloth Bound.

The only Technical Automobile Reference Book Published.

THE purpose of this book is to give tabulated information, data, tables, and formulæ of value to automobile engineers, designers, draughtsmen, manufacturers, managers and others engaged on the production side of the industry. Before the war it had become firmly established as the standard technical automobile reference book, and was universally regarded as the most complete and reliable work of its kind in existence.

The present edition, which is the first published since 1914, is in many ways an improvement on all previous issues. The main features, which have proved their usefulness, are retained, but new ones have been introduced and particular attention has been given to the arrangement of the matter to allow the greatest ease of reference.

The contents include tabulated details of British, Continental, and American private cars, also British commercial vehicles, whilst an innovation is the very complete data relating to the principal aircraft engines of the world that have been included. A large number of new tables, formulæ and general data have also been added.

SYNOPSIS OF CONTENTS.

TABLES AND DATA OF SPECIAL APPLICATION TO AUTOMOBILE WORK:

Including Cylinder Capacities, Circumferences and Areas, Squares, Cubes, Square Roots, Logarithms, and Reciprocals, Conversion Tables, Equivalents, Standards and Gauges, Gear Data, Mild Steel Tubing (sectional areas, weights, etc.), Brooklands Lap Speeds, Reference Tables, British Engineering Standards, etc., etc.

TABULATED DETAILS OF THE BRITISH, CONTINENTAL, AND AMERICAN PRIVATE CARS, BRITISH COMMERCIAL CHASSIS, AND BRITISH AIRCRAFT ENGINES OF 1920.

WORLD'S RECORDS AT BROOKLANDS (to October, 1913).

BROOKLANDS CUBIC CAPACITY CLASSES.

The "IVY" TWO STROKE

TRADE MARK

Does a 2-stroke over 250 c.c. overheat?

NOT IF IT IS AN

IVY.

A.C.U. Officially Observed Trial, July 15th, 1920.

25

Consecutive Ascents (non-stop) of the Old Wyche Cutting at Malvern.

A

3 h.p. IVY 2-stroke

350 c.c.

Successfully carried out the above exceptionally severe test under the auspices of the A.C.U. The Old Wyche Cutting is one of the steepest hills in Great Britain, the gradient at the top being 2·8. The machine ran with wonderful consistency and completed the 25 ascents at an average speed of 18·75 m.p.h. The total distance was 40 miles and the time occupied just over 2 hours. The engine of this machine is our standard production for 1921.

WILKIN, 2¾ h.p. Bl'kburne engine	At list price.
ZENITH, Model G.	At list price.

COMBINATIONS (New).

QUADRANT, 4½ h.p., complete as makers' specification ..... At list price.

COMBINATIONS (Second-hand).

L.M.C., 1920, 4½ h.p., Henderson B.1 Sidecar, all lamps, fully equipped, as new.

L.M.C., 1920, 6 h.p., suspension frame model, Henderson B.1 Sidecar, speedometer, windscreen, lamps, many extras, as new.

P. & M., 3½ h.p., Dunhill Sidecar, apron, lamps, horn, etc., fully equipped.

BAT, 1920, 6 h.p., Henderson Elite Sidecar, grey, Windscreen, Cowey horn, and speedometer, Tan-Sad seat, Luggage grid, lamps, as new; done 150 miles.

TRIUMPH, Renovated, Cadby sidecar, lamps, horn, tools, etc. Fully equipped.

TRIUMPH, 4 h.p., 1920, Henderson feather-weight Sidecar, lamps, horn, apron, etc.

We are Sole Agents for LONDON and the HOME COUNTIES for **L.M.C.** and **WILKIN.** Live Agents please write for terms. Retail Selling Agents, London and 20 miles, **BEARDMORE-PRECISION.** The Motor Cycle that is five years ahead of its time. Contracting Agents for every well-known make from A to Z.

HENDERSON SIDECARS.

A-1 Models for immediate delivery in stock. Elite, B.1, A. and Spring-frame models.

SIMPLEX MOTOR ATTACHMENT.
Fitted to both lady's and gent's cycle for immediate delivery at Makers' List Price.

ACCESSORIES.

A large and complete stock at competitive prices.
Service at all times at the House of "MEBES."

154-156, Gt. Portland St., W.1.

MOTOR CYCLES FOR SALE.

Sun.

SUN-VILLIERS 2-stroke, new tyres and belt, lamp good condition; £48.—Newell, 71, Mount Arar Rd., Richmond, Surrey. [430

SUN-J.A.P. 1916 4h.p. Combination (sidecar 1915 3-speed Sturmey-Archer countershaft gear, Stewa speedometer, double lighting; £115, or near offer. Kimber, 78, Drakefield Rd., Balham, S.W.17. [386

Sunbeam

1914 Triumph, 4h.p., 3-speed, condition perfe £62.—95, Grosvenor Rd., Highbury. [454

8h.p. Sunbeam Combination and Spare Wheel; li price.—Haynes Bros., Ltd., Maidstone. [439

1919 Sunbeam 3½h.p. Combination, as new, re good; £175.—Yellow Garage, Surbiton. [37

SUNBEAM Combination, brand new; list price.—Ne man Whitehouse, Bridgtown, Cannock. [X95

1918 Sunbeam 3½h.p., solo, in splendid conditio £120.—Kays, 8, Bond St., Ealing Broadway. [33

1920 Sunbeam 3½h.p., magdyno lighting, perfe condition; £195.—27, Merton Rd., Bootle. [X95

3½h.p. Sunbeam Combination, brand new, all acce sories; cost £206, offers.—203, Newland Av., Hu [47

1917 Sunbeam Combination, 3½h.p., with lamps co plete; £145.—Kays, 8, Bond St., Ealing Broa way. [33

£100.—3½h.p. Sunbeam, Sept., 1915, new lamps, a cessories, new condition.—63, Solon Rd., Brixto Exchange. [49

1919 3½h.p. Sunbeam (military), perfect conditio offers.—Wilkins, 52, Waldeck Rd., Carrington Nottingham. [43

SUNBEAM 3½h.p. Late 1919 Combination, in exc lent condition, little used; £140.—Prall, Hanle Stoke-on-Trent. [37

SUNBEAM 1919 4h.p. Combination, fully equipp covers, tubes; £155.—Lt. Kelway, Brooklan Langport, Somerset. [37

1920 Sunbeam, 3½h.p., Lucas accessories, milea 200, sports model, July; £160.—Goodman, Ell mere, Northampton. [42

SUNBEAM 1919 4h.p., French Military Model, complete, good condition; £110.—Abell, Newsten Ratcliffe Rd., Leicester. [36

SUNBEAM 1919 4h.p. Combination, covers, tub fully equipped; £145.—R. L. T. Kelway, Broo lands, Langport, Somerset. [38

SUNBEAM Combination, late 1919, 8h.p., hoo screen, Lucas lamps and horn, Tan-Sad; £230 Healey, The Croft, Llandudno. [X95

LUCAS Magdyno Lighting and Ignition Sets Fitte 3½h.p. Sunbeam from stock; others in few day —27, Merton Rd., Bootle, Lancs. [X95

SUNBEAM 1917 3½h.p., kick starter, 3-speed, h.b clutch, lamp, horn, etc., excellent conditio £110.—C. Barton, Clapham, Yorks. [02

SUNBEAM 3½h.p., 3-speed, 1916, black and gold, ne 1920 cylinder, piston and rings, Senspray, origir chains; £100.—62, Gerard St., Derby. [X94

AUG., 1920, 3½h.p. Sunbeam Combination, wheels, interchangeable, Lucas lamp sets, hor tools; £212, or near offer.—Simpson, Chemist, Ibsto [X95

2¾h.p. 1914 Sunbeam, 2-speed, kick start, clut accessories, splendid condition, ready to ride awa £65, or near offer.—Noel, Temple Guiting, Winchcomb Glos. [37

1920 3½h.p. Sunbeam, lamps, Klaxon, Cow speedometer, splendid condition, all acc sories; £170, or near offer.—Morris, Delamere Hou Chester. [X95

SUNBEAM 3½h.p., and coachbuilt sidecar, hoo Cameo wind screen, luggage grid, lamps, spar good condition; bargain, £100.—132, Victoria Dr Eastbourne. [36

SUNBEAM, late 1914, Bosch ZU, 2¾h.p., clutc K.S., starts with touch, 2 speeds, good conditio lamps, horn, and pump; £70.—11, Queen's Rd., Leyto stone, E.11. [41

1919 Sunbeam 8h.p. Combination, all lamps, n speedometer, very well kept, tyres, etc., p fect, owner giving up; £180, or near offer.—'Phon Hamp. 7822. [39

1919 (Oct.) Sunbeam, 3½h.p., black and gold, pict engine, Bosch mag., 600 miles, largest Lu lamps, Klaxon, etc.; £130.—Vallancey, seen 24, Wo stock St., W. [47

SUNBEAM 1917 8h.p., mag.-engine, Lucas elect lighting, finest sidecar, spare wheel, all int changeable, handsome outfit; £170; any trial.—Quee Head, Waltham Abbey. [46

1920 Sunbeam 8h.p. Combination, lamps, spe ometer, horn, spare wheel, mirror, and spm perfect condition; price £210; owner buying car. Estcourt Av., Headingley, Leeds. [40

SUNBEAM 2¾h.p., 2 speeds, countershaft, free gine, kick start, fitted speedometer, lamps, ho stand and carrier, splendid condition; £65.—Murr 37a, Charles St., Hatton Garden, Holborn. [X95

THE MOTOR CYCLE
ESTABLISHED IN 1903
AND FOR OVER SIX YEARS THE ONLY PAPER SOLELY DEVOTED TO THE PASTIME

The Six Days Trials.

IT would appear that the A.C.U. judges did not pay their usual careful attention to "condition" at the finish of the Six Days Trials. Had they done so fewer gold medals would have been awarded. This year, machines with (1) a broken footboard, (2) leaks cured with Plasticine, (3) a broken valve rocker, (4) a broken piston, and (5) a burst silencer were passed with full marks for condition. Clearly the five cases enumerated escaped the usually keen eye of the examiners, who completed their task in three or four hours on Saturday evening. Why such cursory inspection should have satisfied the judges this year, when last September the examination was not only severe but ultra critical, we are unable to explain. There is no object in our hiding these facts, for many competitors well-know the machines we refer to. The effect of the omission to discover and penalise such defects has the effect of discounting the value of a gold medal. No fewer than eighty-eight riders of the ninety-six finishers are provisionally awarded gold medals, when actually a careful examination of the machines under the important heading of "condition at the finish" would have provided valuable data and thinned the ranks of the gold medalists, whilst at the same time increasing the value of the chief award.

There are always grumbles after every big trial, and this year the nature of the route came in for the greatest criticism. It must, however, be realised that the A.C.U. is doing its best to provide for the motor cycles, a year's work in a week's time, and the surfaces must be vile to fulfil such demands. Generally, the trial was well organised, and is bound to benefit the pastime in many ways. It will be observed from our description that certain competitors withdrew in protest against the difficult nature of the route. Their action only served to emphasise the merit of the achievement of those who successfully survived the course.

A Wobbly Policy.

The A.C.U. is, however, somewhat to blame for including hills in the programme which were afterwards omitted on the score of condition. Either these hills should never have been included or else the competitors should have been taken over the route published at all costs. Not only do such changes affect competitors, but also spectators. Some hundreds of keen motor cyclists had assembled to watch the performances at Rosedale Abbey Bank, some having ridden a distance of nearly two hundred miles only to be doomed to disappointment. Notwithstanding the omission of Rosedale, the course for the first two days ensured that this year's trial should prove the stiffest event of its kind ever held, but this is as it should be.

Performances of the Two-strokes.

Outstanding performances were made by some of the little two-strokes which excited the admiration of all spectators. A single-cylinder air-cooled two-stroke sidecar is a novelty in a six days trials, and we are glad to state that such a machine distinguished itself on its first appearance, and completed the course satisfactorily.

One or two sidecar machines were conspicuous for their performances, but freak hills, with really loose surfaces, put the sidecar outfits and three wheelers to a serious disadvantage, since they are often unable to use the only tracks on which wheel grip is attainable.

Brooklands failed to eliminate many of those who survived thus far, a matter of surprise to many who know track conditions, but probably the fact that the speeds set in the various classes did not necessitate full throttle work all the time, saved many first class awards.

The number of gold medals provisionally awarded is high considering the severity of the course, and though this may be partly due to a less rigid final examination than was expected, it speaks volumes for the reliability and capabilities of the modern motor cycle.

An index to the advertisements in this issue will be found on the page facing the back cover.

None Too Sure.

THE other week I advised west-bound motor cyclists to avoid the Moretonhampstead route across Dartmoor, because of the lumbering chars-à-bancs which blanket the narrow, tortuous lanes. I came back east next day, *via* Launceston, on a spring-frame A.B.C. I retract my advice. It is better to die swiftly, beneath the ruthless wheels of a char-à-banc, than to skid and bump for a couple of hours. A few miles north of Bodmin, an unholy alliance between the Cornish rainfall and some timber lorries has trenched the roadway for miles. Where the lorries turn off, potholes commence, and continue as far as Crockernwell, so that only the last dozen miles into Exeter are tolerable. To judge by the convulsed faces of the rigid-framed enthusiasts whom I met, I was by no means the chief or only sufferer. Next time I go west it will be by aeroplane or the G.W.R.

2,000 Miles on a G.N.

A FRIEND of mine has just completed 2,000 miles on a 1920 G.N., and his experiences are of interest to all who believe in the future of the cycle car and consider that three wheels are fundamentally inferior to four. He has encountered no real trouble, though the machine was bought second-hand, and has been worked very hard. Such few attentions as the machine has required have been of the petty order, and relate to a broken valve spring, loose woodscrews in the body work, etc. It is often asserted that a featherweight vehicle cannot be properly sprung, but the suspension of the light G.N. is probably equal to that of so well known a car as the 10 h.p. Singer; I tried both vehicles over the same roads in the same week, and should put them on a par. The chains have not yet been adjusted, though they are now about ripe for tightening; few sidecar outfits would last 2,000 miles without chain tightening. The fuel consumption averages 50 m.p.g., and the little vehicle has altogether given him immense satisfaction.

Our Crowded Inns.

YEARS ago, when I was tame sociologist on the staff of a daily paper, I penned some thrilling articles on "How the Poor Live." I slept in fourpenny dosshouses, and acquired a wide experience of those greedy little insects which Prof. Shipley has immortalised as the minor horrors of war. During August week I was perforce reminded of those bygone days. When I travel on professional duty, my expenses are a matter for the office treasury, and after the manner of employees all the world over, I pull up at the Hotel Superb, and charter one of their best rooms. But this August I had been involved in a slight fracas with my rear chain, which, during replacement, had dropped off the sprockets and flicked me across the nose. So when I sighted my rugged visage in a mirror as the commissionnaire at the Hotel Superb answered tersely, "No room here!" I hied me to a garage, washed, and strutted up to the Hotel Splendide. Half an hour later I meekly and furtively crept up to a shabby little hostelry which bore the plaque of a push-bicycle club. Two hours later I turned disconsolately away from the door of the last inn in the last town to which my carbide would carry me. Moral: book accommodation ahead at holiday times, even at onehorse burghs of an intermediate character. I came near discovering whether the fourpenny doss has gone up to eightpence.

The Number-plate Strafe.

A GOOD many of us are gradually discovering that the police campaign anent number-plates was not primarily inspired by meticulosities about measurements, as seemed to be the case. The real animus is a suspicion that many riders are using numbers which do not belong to them or to their machines, and that others have never paid carriage tax on their machines. If any such sly merchants should read these words, I advise them, in their own interests, to exercise honesty as the best policy. No, I have not been detected using imaginary numbers on eight different 'buses. I have merely been put through a very searching cross-examination about the umpteen machines which I have registered during the past six years. I have had a little fun out of it, as my local authorities are extraordinarily ignorant of the law, an ignorance which is clearly shared by many of the riders who have bought machines from me. Points on which the average practice is weak are as follows:

1. When a machine changes hands, the seller *must* notify the registering authority of the sale, and supply the name and address of the buyer. This terminates the seller's responsibility. It is not his business to transfer the numbers, or pay the fee.

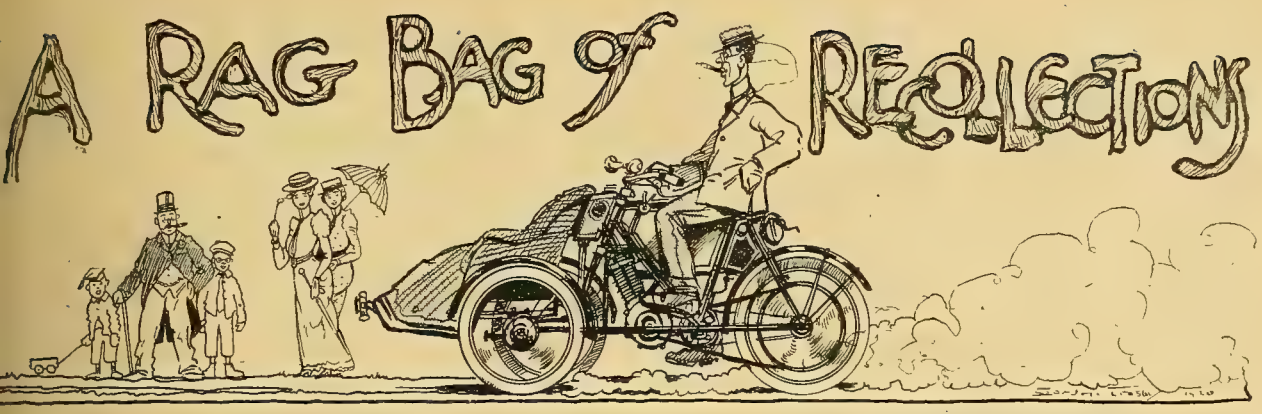
2. The buyer *must* immediately notify the registering authority whether he wishes to cancel or transfer the registration. In the latter case he must pay the fee. Until he has transferred the numbers, the machine is technically unregistered, and he may be punished for riding it.

3. Under the present taxation scheme, all motor cycles are taxed alike, and no new carriage licence is necessary. It is only necessary for every rider to have as many licences as he owns machines.

4. Should the proposed new taxation scheme come into force in 1921, any change of mount will plainly have to be taken up with the taxation people, since motor cycles will be differentiated for taxation purposes according to weight, etc.

At present many buyers lay themselves open to penalties by failing to transfer numbers when they buy machines already registered by somebody else.

A RAG BAG of RECOLLECTIONS



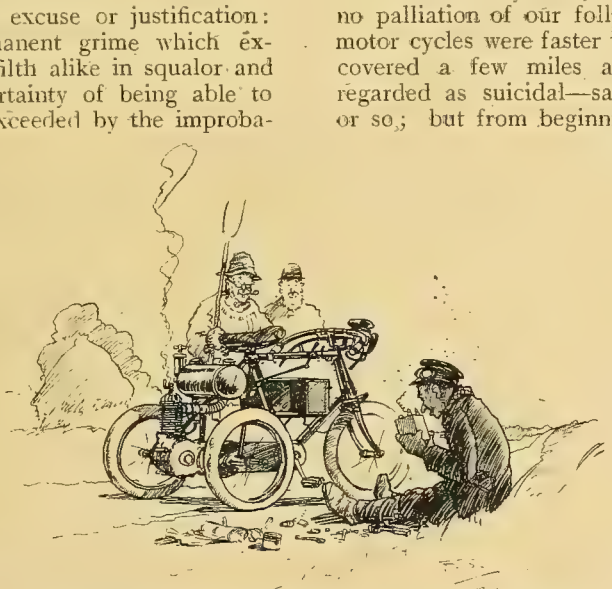
"Ixion" refuses to let Bygones be Bygones and reopens the Book of Time.

An extract from the preface, and the first chapter of a long-promised book by our popular contributor, which will shortly be published by the proprietors of "The Motor Cycle." The title of the book will be "My Motor Cycle Reminiscences," and will contain over a dozen long chapters illustrated with drawings by F. Gordon Crosby, and many old photographs.

THE other day I saw a revival of *The Belle of New York*. Its cast includes a shabby lunatic who amongst other eccentricities strolls into a ndy store, interrupts the lyrics of the spangled horus, and orders a ton of coal. The assembled uts and flappers receive him with a bored, puzzled oliteness. That is exactly how we pioneer motor clists were regarded by the general public twenty ears ago—we were incomprehensible lunatics. Our om was preferred to our company, and only persons ith perfect manners forebore to tell us so.

Merely Tolerated.

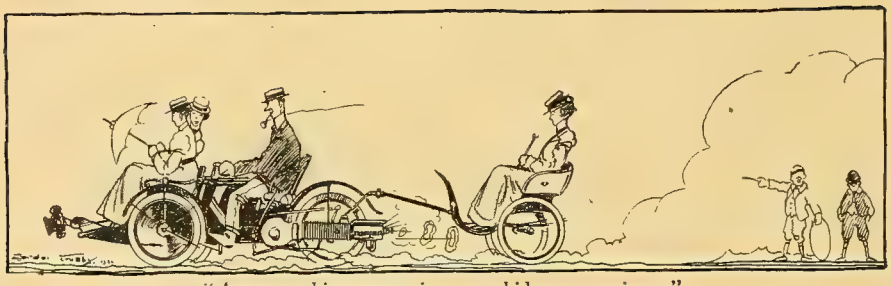
Indeed, unless we frightened people's horses, they ere quite astoundingly polite to us. Our weird obby seemed to be without excuse or justification: veneered us with a permanent grime which exeeded every known form of filth alike in squalor and adhesiveness. The uncertainty of being able to art on a journey was only exceeded by the improbaility of our ever reaching ur destinatoin in the iddle. We were unquesonably doomed to spend ng hours by the roadside, nder conditions that ranged om grilling sun to a frosty ight, from desperate soliude to a seething mob. uch times of penance ere usually devoted to ne identification of some ystic ailment which fflicted our machines. The dds in the first place were eavily against our being ble to trace the trouble; n the second place the etting was equally strong gainst our being able to emedy it, if found. There ere no garages; the longest push could only bring us to the door of some ambitious cycle repairer, more ignorant and less cautious than ourselves.



"Such times of penance were usually devoted to the identification of some mystic ailment which afflicted our machines. The odds in the first place were heavily against our being able to trace the trouble; in the second place, the betting was equally strong against our being able to remedy it."

Difficult Days.

When it rained, we sideslipped and got drenched, for our machines were woefully top-heavy, and the modern dreadnought clothing was not dreamt of. In winter we suffered from frostbite. In summer our engines overheated. Our belts slipped and broke and pulled through without partiality under all conditions; the slip which they developed in wet weather was not more habitual than the glaze from which their leather suffered when roads were dry and dusty. Most of us were ex-cyclists; but such a hideous past was no palliation of our folly. We could not claim that motor cycles were faster than push bicycles; we often covered a few miles at a speed which was then regarded as suicidal—say twenty-four miles an hour or so; but from beginning to end of a cross-country journey the prehistoric motor cycle was generally slower than a scissor-grinder's handcart. We could not claim that we preferred the motor cycle for hill-work; for the main difference between it and the push bicycle, where gradients were concerned, was that the latter was very distinctly easier to push. Economy could be no factor in our inexplicable conduct. A new machine might easily cost £75 to buy. Its repair bill was long enough to stagger a munition magnate, and it was out-of-date soon after it had been delivered. The most sympathetic student



"A run on this monstrosity was a hideous experience."

of human nature might be pardoned for comparing us to the gentleman who carried a slice of toast about with him under the delusion that he was a poached egg.

The Horse Age.

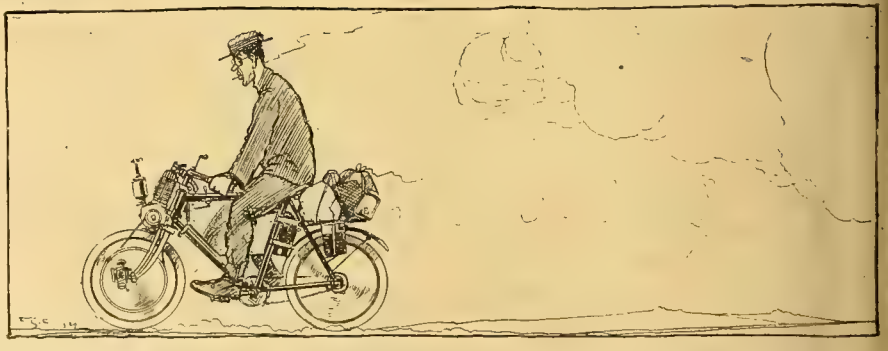
If we were studied from the standpoint of the community, we appeared absolutely unpardonable. The country was horsey in those by-gone days—horse buses, horse trams, horse cabs, horse carriages; every man, woman and child who did not possess a horse occasionally lay awake at nights and dreamt of having one, just as nowadays in our day-dreams lost uncles expire in Kalamazoo City and leave us enough money to run a Rolls-Royce. Now that the horse is all but extinct, I may inform the curious that it was an observant, suspicious, and ignorant animal. When motor cycles first dawned on its vision, it took careful stock of them. Several disturbing points were immediately obvious. Motor cycles smelt abominably. The men who accompanied them on the roads were dreadful ruffians. Sometimes a motor cycle might be met travelling at inconceivable velocities. On other occasions, indeed more commonly, they were found stationary by the roadside. This latter attitude was pure cunning, intended to entice unwary horses up to close range before the noise and smell began. The new monster was evidently a lethal projectile, a kind of bomb on wheels; when it was in motion you could hear the clockwork whirring in its inside, and you would be half deafened by its repeated efforts to detonate. We produced some such impression on the horses of our day. The consequence was that when they sighted us they immediately did an "about turn" and worked up to maximum revolutions in an amazingly few yards. The staidest old Dobbin would instantly become oblivious to the presence of kind mistress and the family barouche behind him. Many nasty accidents occurred as a result, and timid horse owners became afraid to venture on the roads.

The uplift beneath motor cycling in those early days must have been equivalent to a religion, or we should never have borne its manifold disagreeables as we did. It was derived from three motives: Some of us were engineers; we may hardly have believed in the ultimate road possibilities of a featherweight high-speed engine, but even if we privately regarded the machine as a product of Bedlam, it was certainly an amusing little toy. Others gambled on its commercial possibilities. The average cycle agent saw that the papers were full of the new locomotion; he reflected that he made two or three pounds out of every ordinary cycle he sold, plus a small but regular income out of repairing it; a machine which retailed at six times the price of a pedal cycle would be proportionately remunerative; so he took pains to get into the new trade on the ground floor. Others, again, were adventurers, pure and simple. When there is no war on, no filibustering in South America, no uncharted islands to explore, this land of policemen and accurate maps and black coats on Sundays is apt to bore a certain type of temperament. The purchase of a motor cycle imported a spice of risk and uncertainty and Bohemianism into such a life.

In the early days I did not actually own a motor cycle. For one thing I was too poor; for another I was too timid. Neither confession stirs any shame in me. The first motor bicycle I ever rode had its engine insecurely perched on the top of the front mudguard; the carburetter resembled a 2 lb. biscuit box full of lamp wicks and petrol, and the ignition consisted of a platinum tube kept red-hot by means of a petrol burner. The contraption cost about £50 to buy, and perhaps £1 a week to run. I was in at its death—it sideslipped on the grease in the Euston Road, leapt on top of its owner, pummelled him severely, and, catching fire, burnt itself to scrap-iron. Such costly spectacles did not commend the investment to an ambitious youth with a career to be carved. So I owed my first road experiences to rich and foolish friends, and they usually confirmed my decision not to own a machine.

A Ghastly Mechanism.

Take the Bollée tandem for example. This ingenious three-wheeler had a large air-cooled engine placed horizontally in line with the rear chain stays. Amidships was a gigantic cavern, containing a three-speed sliding gear, the shafts of which were supported in bearings attached to a particularly bulky frame. The transmission from the gear box to the back wheel was by means of a short flat belt, three inches wide: in lieu of a clutch, the back wheel was levered forward in the frame to slacken the belt during gear changes. A run on this monstrosity was a hideous experience.



"The first motor bicycle I ever rode had its engine insecurely perched on the top of the front mudguard. The carburetter resembled a 2 lb. biscuit box full of lamp wicks, and the ignition consisted of a platinum tube kept red hot by means of a petrol burner."

A Rag Bag of Recollections.—

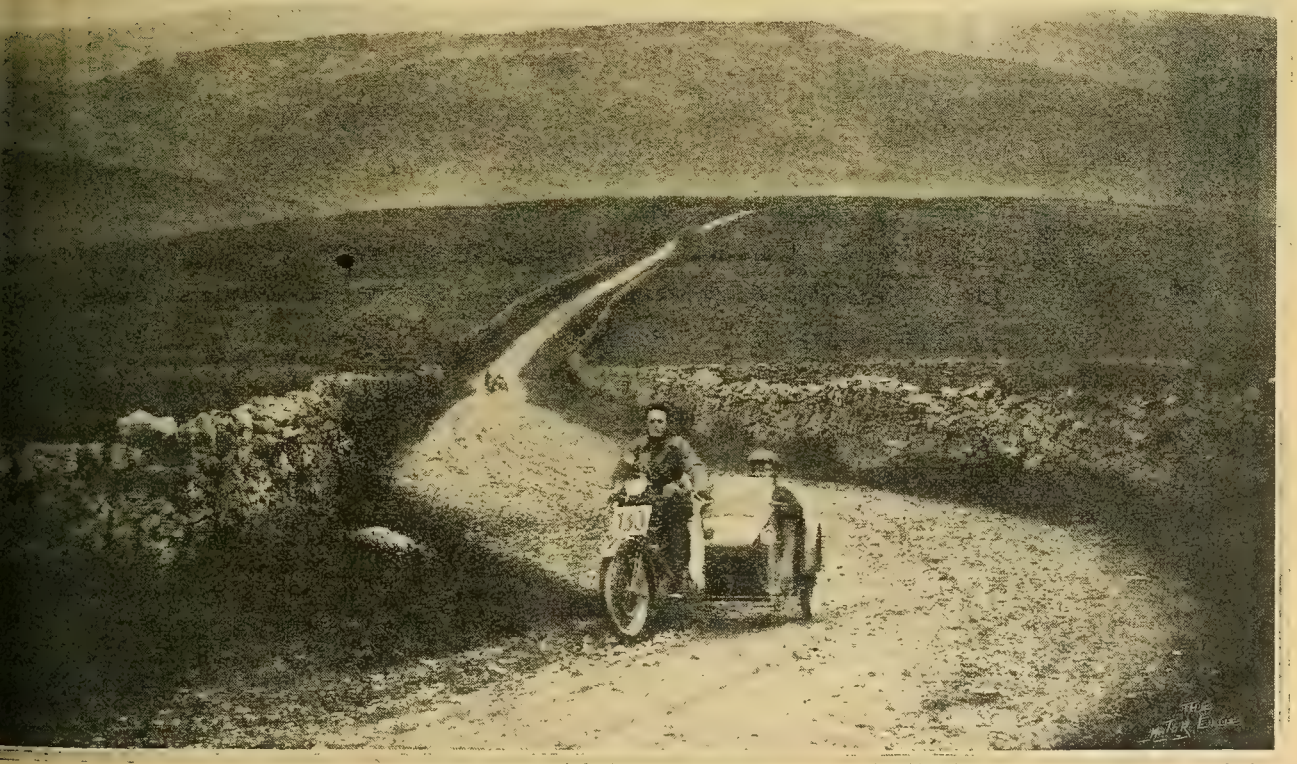
At the outset the thing cajoled you by a twenty-mile non-stop. Then the gearshaft bearings got out of truth. You uncovered the central cavern, and ladled in a hundredweight of grease with a large wooden spoon. Then the cylinder began to glow redly. You took it off and found the slots of all the piston rings in line. Then the belt slipped. Then the belt broke. And so on.

An Early Victorian.

Motoring on such a Pegasus was lively, even when an expert accompanied the novice. Occasionally we ventured abroad without a tutor. A gilded youth of my acquaintance possessed a spider wheel machine, the make of which escapes me. He called it his "victoria" from the shape of its coachwork. He invited two of us to travel out from Oxford to Bicester to dinner one summer evening. The beastie did the outward journey non-stop. Two hours later, full of meat and wine, we emerged into the hotel yard to start the engine before an admiring crowd of ostlers. Four hours later three sweating, wearied men had exhausted every known expletive, and still the engine was mute. Finally she started. She ran rather badly for four miles, and came to a standstill. The crew disembarked, and wondered. One of us struck some matches. By their fitful light we spotted a wet stain on the road behind the car—in fact, a wet trail leading Bicesterwards in the darkness. "The water's leaking," quoth the skipper. The first mate investigated the stain somewhat closely with a match. Over the smouldering ashes we decided that the leakage must have been petrol.

With another novice I essayed a fifty-mile trip on a weird four-wheeler, having two wheels in the centre, one in front, and one behind. I believe it was an Ariel tricycle, with the rear half of a ladies' bicycle attached to the back axle, trailerwise. Anyway, it went uncommonly well. We accomplished the outward journey without incident. One mile back on the way home it stopped dead. We discussed and surveyed for hours; but as neither of us had the least notion as to the name of any part, or even as to how the engine worked, we got no forrarder. At last I discovered a small brass nut lying on the road behind the machine. It might have fallen off the machine; or again, it might not. We decided to hunt for a vacant stud or bolt. After three-quarters of an hour we spotted an insignificant little thread projecting from a cone of white china behind the tricycle saddle. Triumphantly we screwed the brass nut back, and for the next half-hour we pedalled the outfit madly up and down the road in efforts to start the engine. Fate frowned on us. There was nothing doing. Another dismount. Further discussion. At last my companion drew my attention to a rather limp-looking wire, hanging down in rather detached fashion from a small black coil.

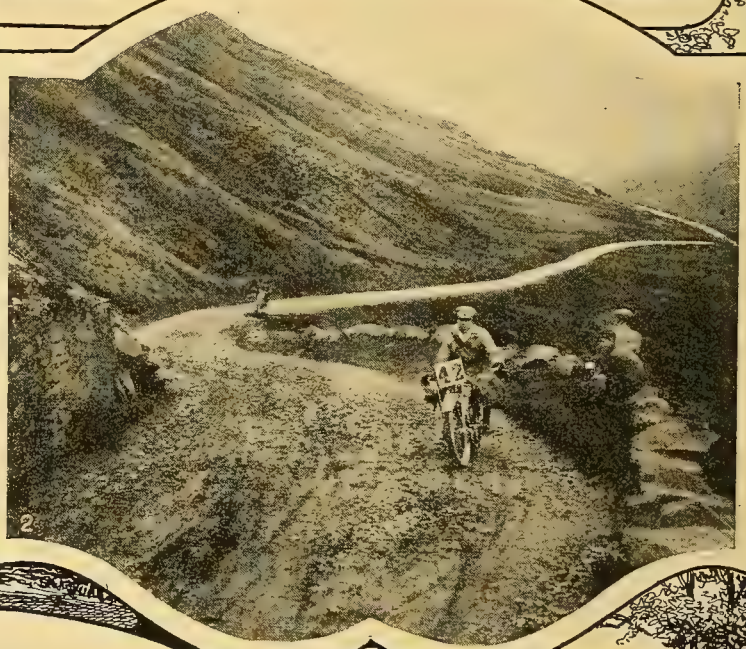
"That looks as if it ought to be tied up somehow," he opined. It was my brain that leapt to the idea of attaching the wire by the brass nut to the porcelain cone.



A.C.U. SIX DAYS TRIALS.

Buttertubs Pass. In the foreground, Douglas Alexander (8 Enfield sidecar), whose hill-climbing was a feature of the trial. A31

Scenes in the A.C.U. Six Days Trials.

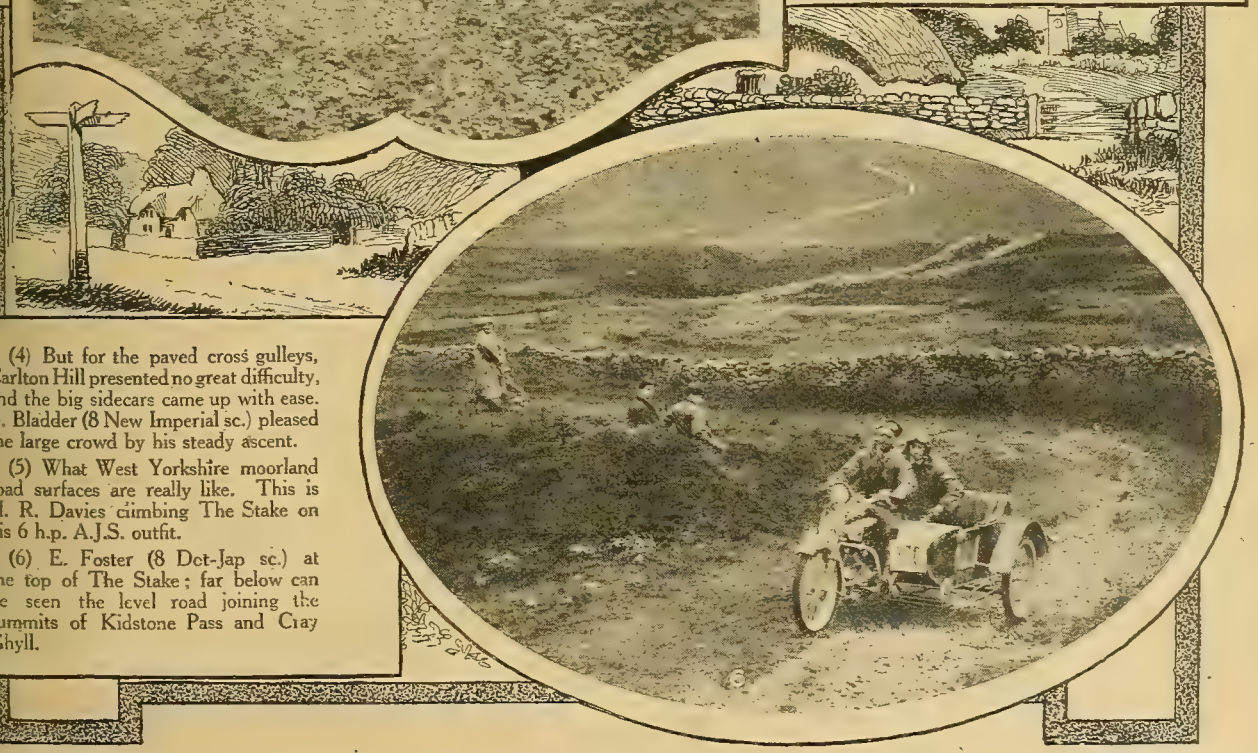


(1) Except to those who know its difficulties, Park Rash is almost unclimbable on a sidecar outfit. W. J. Montgomery (5-6 Rover sc.) and E. Williams (6 A.J.S. sc.) have their passengers on the carriers to prevent wheel slip.

(2) F. J. Fieldhouse (3½ N.U.T.), followed by F. A. Longman (3½ Ariel), on Buttertubs Pass, in Wensleydale.

(3) The lightweights have done wonderfully well. F. Porter (2¾ Levis) is shown in the midst of a confident climb of Boltby Bank.

Even the camera cannot adequately convey a full idea of the gradients and surfaces encountered. These pictures show some of the worst hills in the Trial.



(4) But for the paved cross gulleys, Carlton Hill presented no great difficulty, and the big sidecars came up with ease. B. Bladder (8 New Imperial sc.) pleased the large crowd by his steady ascent.

(5) What West Yorkshire moorland road surfaces are really like. This is H. R. Davies climbing The Stake on his 6 h.p. A.J.S. outfit.

(6) E. Foster (8 Det-Jap sc.) at the top of The Stake; far below can be seen the level road joining the summits of Kidstone Pass and Cray Ghyll.

LETTERS TO THE EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters must be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

A.C.U. SIX DAYS TRIALS.

Sir,—After shouting myself hoarse warning people to "clear the course" on Monday afternoon at Park Rash, I am sorry to report that I was guilty of baulking a rider who was one of the last to arrive. That I did this under a misapprehension is no excuse, and I apologise most humbly for my stupidity. I think the number was one of the eighties and the machine a B.S.A. He nearly bowled me over, in which event I should have been jolly well served.

Southport. N.A. 5744.

CHIVALRY.

Sir,—Miss Peall's letter has been a revelation to me. Previously I have held the opinion that the lady rider had the best time of all upon the highway, for it is almost inconceivable to me that any man, however urgent his business, could pass a lady obviously in distress.

All the male riders I have met so admire the pluck of lady motor cyclists that they are only too ready to render them any assistance in their power.

I may, however, add, from my experience, and speaking in general, it is of little use to expect assistance from the pedal cyclist or the car driver, but I sincerely hope that Miss Peall may yet form a different opinion at any rate of the motor cycling boys of eighteen and twenty.

But if an Englishman can treat a lady thus, the day is approaching when he must cease to boast his nationality.

Louth. DOUGLAS.

A.C.U. SIX DAYS TRIALS.

An abrupt corner following the descent of Satron Side. The competitors are H. Jepson (8 Zenith sidecar) and H. P. Knowles (2¾ Hobart).

THE TWO-STROKE AS A TELL-TALE.

Sir,—I was interested in "Notes for the Novice" on carburetters (Chapter III.), and have derived some benefit therefrom. In his remarks *re* perfect mixture, however, I presume the writer was referring to four-strokes. I saw no reference to two-strokes. This is a common fallacy; the two types perform differently. Regarding the sooted plug test, this will not apply to a two-stroke; the latter, if correctly lubricated, consumes too much oil to allow any dry soot to accumulate. One of the advantages of a two-stroke (usual three-port type) is that it automatically regulates the correct mixture. If the mixture is too rich the engine rebels by four-stroking, while if too weak it will spit back through the carburetter—this is, of course, provided the ignition and other factors are right.

I have a W.S.R. variable jet fitted to my Amac double-lever carburetter, and I can descend a gentle gradient without four-stroking. I can also run along at 3 m.p.h. (on low) with the engine two-stroking constantly, and am able to paddle away from cold inside three feet (measured).

I should like to testify to the efficiency of the L-M plug; the porcelain is magnificent. I have already run 2,000 miles on one, and it has never given me the slightest trouble. It is perfectly clear every time I inspect it, and it is still going strong, although the electrode is slightly burnt.

In conclusion, I think the two-stroke a delightful machine—*if taken care of*. In my opinion the four-stroke is doomed to extinction as soon as the two-stroke is perfected. The advantage of the more constant torque is at once apparent.

Manchester. TWO-STROKE ENTHUSIAST.

A PETROL CONSUMPTION CHALLENGE.

Sir,—Referring to A. K. Gordon's letter relative to petrol consumption on the "Scott," the correct way to tune up a Binks carburetter is to fit three jets of the correct size. If when running on the first pilot jet the machine accelerates permanently when the extra air lever is opened slightly, this jet is too large, and the same applies to the second jet and to the main jet. When the carburetter is correctly jetted when running on any or all of the jets the machine should not accelerate, but rather ease up if the extra air lever is opened. This proves that you are then running on a correct mixture and the most economical mixture possible, and when riding the machine and you are only using one of the three jets the other two are damped out and no petrol can be spilled out of them; consequently, when a machine is so jetted no further advantage is possible.

We get scores of letters from users saying they are getting from fifty to seventy miles to the gallon. It is quite possible to exceed this amount by what I call freak riding. One of my customers once wrote me, saying he had achieved a twenty-five-mile journey at the rate of 155 m.p.g.; but I am open to challenge any other carburetter or rider to get as many miles to the gallon as I can get with my carburetter. The test journey that I would suggest would be from Manchester to Preston, over Belmont Hills, about forty miles, the condition being that I will take my Scott out with a standard Binks carburetter in competition with any other standard Scott machine with any other carburetter, and I will set the pace, and when on arriving at Preston the competing machine will have used as little petrol as I have done, I will give £10 to any charity the editor likes to mention, provided my competitor will do likewise, but a condition would have to be that the competitor keeps within ten yards of me through the entire journey. C. BINKS.

APPRECIATION

Sir,—I have seen in your valuable paper comments on "Lack of Finish." I thoroughly sympathise with "Disappointed" and "Charge Engineer," but I must add that my 2½ h.p. Sparkbrook is an ideal machine for finish, and is the admiration of all my friends, one of whom went off and bought the sister machine.

Several people when they knew I was getting a two-stroke advised me to the contrary, saying it was slow, a bad hill-climber, and got overheated so quickly, etc. I have had my machine some little time now, and I have found it speedy, excellent on hills, such as Hindhead and others, often leaving other machines and cars far behind, and the machine has never failed me, even in the worst weather.

Before ending, I would like to bring to your notice the unwillingness of garages to open a two-gallon tin of petrol for a rider who only requires one gallon. The other day I had to push my machine two and a half miles to a garage at which I purchased the desired amount. I feel sure that many riders have only a gallon tank, and therefore perhaps have felt either the need of one-gallon tins, or the stirring up of these disobliging places. I would like to hear other riders' opinions on the subject. TWO-STROKE.

Woking.

The experimental Scott Sociable was seen on several occasions on the Six Days route last week. Mr. Alfred A. Scott is here seen passing through the watersplash near the summit of The Stake. He also climbed Park Rash on his latest creation.

Sir,—May I encroach on your good nature by annexing a small portion of your valuable paper?

I started off from Northwood, Middlesex, recently, with my brother. Our machine was an 8 h.p. Blackburne and Canoelet sidecar. We covered 155 miles on the first day by speedometer, and averaged 23 m.p.h. for the whole run, while our petrol consumption was 62 m.p.g. The total weight carried was fifty-five stone.

The machine had only covered 108 miles previously, and so was not run in. We had no trouble of any sort during the whole of the trip, which we completed on the second day after covering seventy miles to Ilkley. We have now had three Blackburnes between us, and I may say, with all due respect to other makers, that there is not a machine on the road to-day that we would change for ours. (We add the usual disclaimer.)

As regards the roads, they are perfect from St. Albans to Doncaster, but directly one gets to the north side of Doncaster they develop into a miniature battlefield, with shell-holes every few yards. It is nothing more or less than a disgrace to the West Riding Council.

NORMAN B. SHALDERS.

FITTING A SPEEDOMETER.

Sir,—I have just read "Speedometerless's" letter in your issue of the 19th ult., complaining of speedometer fitting, and am very surprised that both he and the garage manager are at a loss for a remedy.

The same defect was very plain to me when I fitted the speedometer to my B.S.A. and to my previous machine, a 2¾ h.p. Douglas, but I did not risk an accident. Instead, I reamered out a suitable washer to slip over the wheel spindle, and then cut down the outside diameter of the washer, so that it just fitted the rebate in the fork-ends. The front wheel was put back, the washer slipped into place (thus doing the same work as the collar on the nut supplied, viz., keeping the spindle from falling out), then the small spindle bracket slipped on, and, lastly, the nut. Result: perfect safety for the last four years, at a cost of fifteen minutes extra work.

Should "Speedometerless" not be able clearly to understand my description, I will gladly make the necessary part, or send him a sketch. SOLUTION.

Sir,—I have read with interest the letter of "Speedometerless" in the issue of August 19th.

I have several times had similar cases come to my notice, but can assure "Speedometerless" there is no necessity for him to adhere to his *nom-de-plume*, as the Watford people have for twelve months supplied an instrument which in no way interferes with the front spindle. The bracket which carries the small pinion is secured to the front forks by adequate clips, and during the present season I have fitted dozens without any subsequent trouble.

I am sure if he wrote Messrs. North and Sons, they would give him full details and doubtless an illustration.

Gosport. W. J. REYNOLDS.

[Letters have also been received from several other users of Watford speedometers on the same lines.—ED.]

Sir,—I have read the letter of "Speedometerless," in your issue of August 19th with interest. In the first place I consider the carelessness shown in fitting the speedometer to your correspondent's machine blameworthy.

Last year I bought a B.S.A. and wished to fit a "Watford" speedometer, but I undertook the work myself. I soon found that the clip of the speedometer would prevent the collar of the nut on the off side of the spindle being screwed into the rebate in the fork, so I had one sixteenth of an inch turned off the flange of the nut, and I filed the flat clip down by one thirty-second of an inch, thus prolonging the collar three thirty-seconds of an inch, which was of sufficient length to make the front wheel safe. That it was a success is proved by the fact that I afterwards rode the machine over 2,000 miles, and then sold it to a party who has since ridden it a further 2,000 miles without the nut once having come loose of its own accord.

Bradford. AMATEUR MECHANIC.

PLUG EFFICIENCY.

Sir,—I have read with much interest the articles on plugs that have so often appeared in the Correspondence pages. As yet I have not found any reference to a plug that was given to me about eight months ago by a two-stroke rider. This motor cyclist came to my aid when I was stranded with a burnt-out plug on the back cylinder of my Douglas (spares lost through tool-bag jolting open). It has "Heath Patent" printed on the insulator, and seems to possess the apparently impossible feature of neither oiling up nor overheating, although I have put five plugs out of action since. It seems rather a pity that such a good plug should be practically unknown. I have tried to get one a good many times since, but without success. Can any reader tell me where it is obtainable?

Golder's Green. DOUGLASITE.

[The makers of the Heath plug are Heath Plugs, Ltd., Sancroft, Kennington Cross, London, S11.—ED.]

WHAT IS HAPPENING TO THE TRADE?

Sir,—I heartily endorse everything written by "One who watches" on "What is Happening to the Trade."

I paid over £200 for an outfit which I have ridden a few times. I have been kept waiting so far ten weeks for a replacement part costing 3s. I am much attached to this make of machine, but the poor service I have of late received has decided me to try elsewhere for my next mount, though I know it will not give me such satisfaction.

I trust, sir, that this letter will not evoke columns of correspondence again on "Good Service," for I am convinced that such is the exception, not the rule. The object of some manufacturers to-day is to get rid of new machines. They appear then to lose all interest in the client. However, a year or two will tell its tale. PEDESTRIAN.

Loughborough.

POLICE PERSECUTION.

Sir,—Much as I dislike the attentions of the man in blue when on the road, I nevertheless can confess to little sympathy with "K.A.M." in his whine about the police campaign against long exhausts in Edinburgh. It is about the first campaign initiated by the police against motor cyclists which has glimmerings of reason in it. There is no rhyme or reason in the ridiculous lengths of flue piping which one sees attached to every second or third motor cycle, and the motive of their owners in transforming a muffled boom into a barking crackle is quite beyond me. If they think it impresses the lay public with the terrific power and speed of their machines, they are much mistaken, for there is nothing more exasperating to people whose houses abut upon main roads than motor cycles with exhausts like that of "K.A.M."—"4½ft. long and 2½in. in diameter."

The argument about silence being a cause of accident is worn so thin as to be merely silly; one does not hear of the wholesale slaughter of riders of Scott machines.

Much of the police persecution is, admittedly, to be deplored; but I think a good deal of it is due to excessive noise and speed on the part of motor cyclists in places where noise and speed are entirely undesirable, and merely give motor cyclists in general a bad name. And I think if the police would transfer their "traps" to dangerous corners and cross-roads, their efforts would be *useful* rather than an annoyance. But long exhausts are a sign of pure selfishness on the part of the rider, and a perfect nuisance to the whole community; and I hope the police will continue this campaign and extend it throughout the country in lieu of their efforts against, for example, inadequate number plates, which cause annoyance to nobody. DUGGIE.

Cambridge.

Sir,—I have just bought a 2¾ h.p. motor cycle of a popular make from a motor cycle mechanic in this town. The machine, instead of having a silencer on (which I understand it should have in the usual way), has two separate exhaust pipes, from either cylinder to the rear, the pipes having slits in and partially closed ends.

When the machine is going a decent pace the exhausts emit a kind of cr-crackle. The first time I went out with it I was told by a police superintendent that I should have to have a silencer fitted at once.

Now the previous owner had it eight months, had ridden hundreds of miles, passed scores of policemen, and ridden through many large towns, and had never been pulled up once. Why is it then that I should be pulled up the first time I was on the machine? I do not mind having to fit a silencer, but what, to my mind, was unfair, was that the old owner could ride the machine for eight months, lives not far from the police station, and should never be pulled up once, although riding it in the same condition as I bought it. It is such things as this, and petty trifles such as measuring number plates, etc., that rankle the motor cyclist, and cause criticism. THE PIKE.

Pickering.

AUTO-WHEEL ON TANDEMS.

Sir,—I have followed with much interest the discussions appearing in your journal on lightweights. I am running an Auto-wheel attached to a lady-back tandem and find the combination very successful, and now do rides with lady passengers I would have never attempted before I fitted the Auto-wheel. I have a three-speed gear on the tandem, and always assist the engine on hill with the pedals. Have any of your readers had experience with the "J.E.S." motor bicycle? B.Y

SUMMARY OF CORRESPONDENCE.

PLUG EFFICIENCY.—In recent issues we have published letters from a reader who signed himself "An Old Hand" anent the respective efficiency of British and German plugs, and from the makers of Cooke plugs, who offered our correspondent a set of plugs for test. The firm in question desired that the report of service in "Old Hand's" machine should be published in these columns. The following is "Old Hand's" further contribution on this question: "Sir,—Since my letter of May 27th, under the above heading, appeared in *The Motor Cycle*, I have had the pleasure of testing a good number of plugs, courteously sent to me by British plug makers. During the time I have had my present machine I may say I have tried no fewer than fifty-two plugs, *i.e.*, twenty-six different types, and up to July 16th have only found two plugs of British make that will drive it. One of them is a plug made by Howard S. Cooke and Co., which they referred to in their letter in your issue of June 16th. I accepted their offer and conditions, and find, as far as my engine is concerned, after exhaustive tests, that their plug gives almost exactly the same results as the Bosch single point plug with regard to speed, power, and petrol consumption, the most noticeable features of similarity being slow starting, with a little misfiring. When warmed up both plugs fire regularly, but the engine travels with a sluggish beat. The other plug referred to is the Apollo No. 1, a pair of which I have tested for the Apollo Co. The way my engine starts, the manner in which it ticks over at a crawling pace, and the power and speed the engine develops with the Apollo plugs, in comparison, has simply amazed me. My mileage per gallon of petrol is also increased considerably. I have tried every conceivable plan to put this plug out of action without success. In every way it outclasses, I am pleased to say, the Bosch, which I have had to depend upon for so long.—AN OLD HAND, Ashington."

BOOKS AND MAPS FOR MOTOR CYCLISTS

Issued in conjunction with *The Motor Cycle*.

	Price net.	By post
"MOTOR CYCLES AND HOW TO MANAGE THEM." The standard handbook of the motor cycle. Covers every subject relating to all types of motor cycles, their management and care. Twenty-first Edition. Just published ..	2/6	2/10
"HINTS AND TIPS FOR MOTOR CYCLISTS." Containing over 400 useful "wrinkles" and helpful hints in regard to motor cycles Seventh Edition.	2/-	2/2
"TRACING MOTOR CYCLE TROUBLES." A reliable system for tracing motor cycle faults and of remedying any trouble when found. Fourth Edition.	2/-	2/2
"THE MOTOR CYCLE" ROAD MAPS England and Wales. Scotland. London (showing roads into and out of London and avoiding London). Mounted on linen. Set of three, complete in case.	5/6	5/10
"THE MOTOR CYCLE" ROUTE BOOK. With 32 pages of Road Maps of England and Wales, Scotland, and the London District. New Edition. Just published	5/-	5/4

Obtainable by post (remittance with order) from ILIFFE & SONS Ltd., 20, Tudor Street, London, E.C.4, or of leading Booksellers and Railway Bookstalls

West Birmingham M.C.C.

A one-day reliability trial is being arranged for September 26th, and an entry of at least fifty is expected. Particulars are available from Mr. A. J. Jacobs, 268, Hagley Road, Edgbaston.

Runcorn and District M.C.

A hundred miles sporting trial will be held by the Runcorn and District M.C. on the 5th inst., beginning at 10.30 a.m., and starting from Moughland Lane (Park End). The course will be Runcorn, Chester, Wrexham, Llangollen, Ruthin, Mold, Chester, Delamere, and Runcorn.

N.M.C.F.U. (Sheffield).

On Saturday the members of the N.M.C.F.U. in the city of steel makers will hold a sports meeting, while on the 12th inst. a paperchase has been arranged. This event will start from Owler Bar at 10.30 a.m.

Bristol M.C.C.

Twenty-three riders competed for the Douglas Cup in the Bristol Club's Trial on the 21st ult. The following obtained gold medals: 1 (Douglas Cup and gold medal), J. Langfear (5-6 h.p. Clyno and sidecar); 2, W. Courtney (3½ Sunbeam and sidecar); 3, S. Powlesland (3¾ Scott and sidecar); 4, F. A. Simpson (2¾ Douglas); 5, two competitors tied—W. Ousley and Eli Clarke, sen. (3½ Sunbeam sc., and 6 Douglas sc.).

Dorchester M.C. and L.C.C.

A speed hill-climb on Portesham Hill was recently organised by the Dorchester Motor Cycle and Light Car Club.

There was some delay at the start owing to the difficulty experienced in timing on such a winding hill, but this was soon satisfactorily settled, and the 350 c.c. class run off, the first man away being C. B. Brudenell on a 2¾ Coulson-B, which made a steady touring climb. The fastest time in this class was by H. Peckham, riding a 2¾ Douglas, time 1m. 4⅕s. A very creditable performance was also put up by G. Pursey, riding another 2¾ Douglas, which seemed to have a remarkable turn of speed.

The 600 c.c. class was very representative, and consisted of Triumphs, Nortons, A.B.C.'s, Veruses, and Douglases. All the competitors made splendid climbs, but the 4 Triumph, ridden by A. J. Trenchard, and the 3 A.B.C., ridden by A. E. Hann, particularly excelled themselves.

In the unlimited class amazing speeds were attained by J. Caslake, jun. (Harley-Davidson), C. Taylor (3 A.B.C.), A. E. Hann (3 A.B.C.), and A. J. Trenchard (4 Triumph), the result being a victory for A. E. Hann, who covered the distance in 51⅘s., thereby beating his record by ⅖s., and making fastest time of the day.

Future Events.

Sept. 2.—Norwich and District M.C. Hill-climb.
Sept. 4.—West Birmingham M.C.C. Paperchase.
Sept. 4.—N.M.C.F.U. (Sheffield). Gymkhana.
Sept. 4. Loughborough and District M.C.C. Hill-climb.
Sept. 4.—Dewsbury and District M.C.C. Run to Burnsall.
Sept. 4.—North Lindsay A.C. Paperchase.
SEPT. 4.—WOOLWICH, PLUMSTEAD AND DISTRICT M.C. QUEEN TRIAL FOR MATCHLESS CUP.
Sept. 4.—Eastern Valley M.C.C. Hill-climb.

Sept. 12.—Woolwich, Plumstead and District M.C. Picnic.
Sept. 12.—Scarborough Mm and M.C.C. Run to Falling Cross.
Sept. 13.—N.M.C.F.U. (Portsmouth). Run to Cocking Causeway.
Sept. 12.—Loughborough and District M.C.C. Run to Letterworth.
Sept. 15.—N. Wilts. M.C. and L.C.C. Picnic.
Sept. 18.—Southampton and District M.C. Hill-climb.
Sept. 18.—West Birmingham M.C.C. Run to Stratford.
Sept. 25.—Plymouth and District M.C. and L.C.C. Reliability Trial.

Coventry and Warwickshire M.C.

Owing to the absence of many members at the Six Days Trials, the committee has extended the closing date for entries for the hill-climb at Stile Cop (September 14th) until Saturday next.

Berwick and District M.C.

Recently a surprise run was held in which A. Welsh and J. R. Brown secured first and second places respectively, while last week-end was set apart for a reliability trial to Peebles, *via* St. Mary's Loch.

Southampton and District M.C.

A speed-judging and reliability trial was held on August 21st over a forty-mile circular course in the New Forest district. Fifteen out of the seventeen starters made non-stop runs, and the winner was H. Hobbs (3½ Sunbeam sc.), error nil; 2, E. C. Prince (2¾ Douglas), error 3m. 57s.; 3, W. T. Hunt (8 Rex-Jap sc.), error 5m. 56s.

Isle of Wight M.C.C.

The first annual reliability trial of the newly formed Isle of Wight Motor Cycle Club was held on Saturday, August 21st.

The course, which was a circuit of the Island, was about seventy-five miles, and included some very stiff hills and bad roads. It was keenly contested, and no speedometers were allowed. Result: 1, G. Scotney (6 h.p. Enfield sc.); 2, F. Eyles (5-6 Zenith) and E. Warrior (8 h.p. Chater-Lea); 3, W. C. L. Brown (3½ Indian) and A. Elderfield (6 h.p. Enfield).

Worcester and District M.C.C.

The results of the one-day reliability trial, which was held on August 7th, are now finally announced as follows:

GENERAL CLASS (PASSENGER).—G. H. Leeke (8 Morgan) and W. A. Carr (8 Morgan) tied for president's cup and gold medal; O. K. Bevington (3½ Sunbeam sc.), silver medal.

GENERAL CLASS (SOLO).—W. H. Harris (6 A.J.S.) and F. Drew (3½ N.U.T.) tied for E. Williams's cup and gold medal; N. Brain (3½ Sunbeam), silver medal.

EXPERT CLASS.—G. G. Barnard (3½ Sunbeam sc.), B. Bladder (8 New Imperial sc.), and T. B. G. Vale (4 Norton) gold medals.

TEAM PRIZE.—W. A. Carr, G. H. Leeke, and J. M. Dosher.

SECRETARY'S NOVICES' PRIZE.—Solo, L. Warren; passenger, R. E. Quant.

MRS. BEVINGTON'S PRIZE.—A. Thomas.

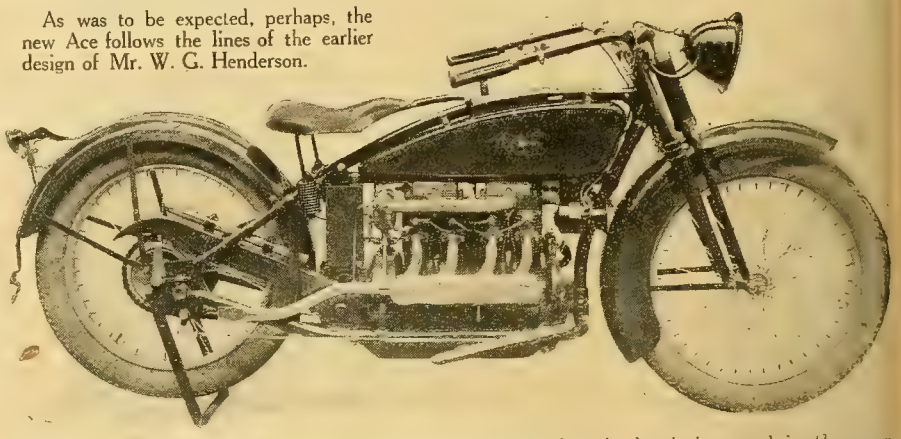
The Four-cylinder Ace American Motor Bicycle.

Car-type Power Unit, 68 mm. × 82 mm.; 1,192 c.c.

THE four-cylinder Ace, which was briefly described in *The Motor Cycle* of February 26th, 1920, has now arrived in England, and delivery can be made from stock by Messrs. Melchior, Armstrong, and Dessau, 14, Great Marlborough Street, London, W.1.

Since it was designed by Mr. W. G. Henderson, it is not strange that it bears a very strong resemblance to the machine which carries his name; but when we study the interior mechanism, we find important innovations. The frame is of very strong construction, being made of heavy gauge tubing. It is of the duplex variety, and carries the engine in a horizontal cradle. Instead of the ordinary saddle tube are two steel stays joining the rear forks and chain stays on both sides of the back wheel.

As was to be expected, perhaps, the new Ace follows the lines of the earlier design of Mr. W. G. Henderson.



Enclosed Overhead Inlet Rockers.

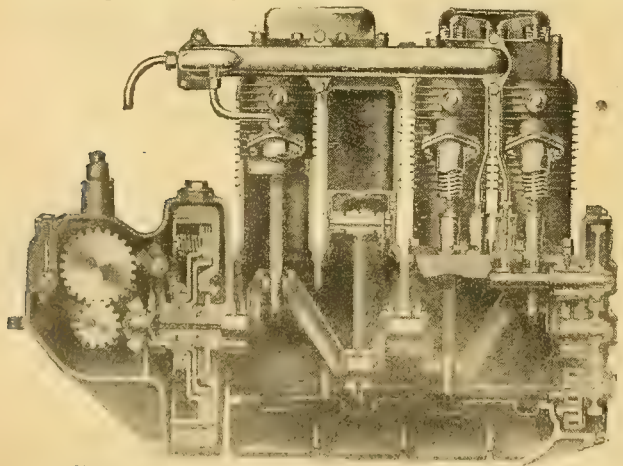
Externally, the engine is reminiscent of the o.h.v. Henderson, but the inlet valve rockers and springs are totally enclosed by means of special pressed steel housings, on the top of each of which are six holes for oil protected by a lid kept closed by means of a spring, consequently all dust and dirt are completely excluded. The inlet valves themselves work in cages, and are 1½in. in diameter with a lift of ¼in. The inlet valve cages consist of two castings in pairs, and the general exterior appearance of the engine is most attractive. The exhaust valves are of the usual pattern, and both they and the overhead inlet valve tappet rods are provided with large adjustable tappets.

The lubrication system is interesting. Here, as elsewhere in this engine, motor car practice has been closely followed. There is no separate oil tank. The crank case is designed to hold three quarts of lubricant. Driven off the timing gear at the forward end of the crank case is a gear pump, which draws oil from the sump at the bottom of the crank case and sprays it into troughs moulded in a tray above the normal level of the oil. These troughs are consequently kept full of oil, and the big ends, which are provided with dippers, dip into oil at each revolution, lubricating their bearings and filling the crank case with oil mist. The excess of oil flows back to the sump through a hole in the centre of the tray. The level of the oil is ascertained by a steel rod dipping into the base of the sump, which, if withdrawn, shows the level at a glance. Air is introduced into the crank case through a breather provided with suitable baffles to prevent the oil from being blown out. The exit of the breather is turned downwards to the ground so that no oil is sprayed upon the exterior of the crank case.

Large Bearing Areas.

Noteworthy also are the dimensions of the principal bearings. The front bearing is 1¼in. long, the centre bearing of the four-throw crankshaft 1½in., and the rear bearing 1¼in. Following automobile practice, the bearings are of bronze, lined with white metal.

A Schebler carburetter is fitted which delivers the gas into an inlet manifold of special construction provided with a wall that extends to a point midway between the two valve inlets. Gas follows along the wall to the central point, whence it travels equal distances to each inlet, thus equalising the distribution. A "hot spot" is provided by a projecting elbow on the rear end of the inlet manifold, which is connected to the exhaust of No. 4 cylinder by means of a small pipe.



The Ace engine retains many of the characteristics of Mr. Henderson's previous design, including overhead inlet valves.

Automobile practice has been so far followed that the bottom of the aluminium crank case may be removed without disturbing the engine, and is provided with ribs to give additional strength and to assist in cooling.

The gear box contains three speeds and a bevel transmitting power from the crankshaft to the sprocket, which is connected to the rear wheel by means of a single chain; and in the rear half of the crank case casting is a housing for the flywheel and multiple-disc clutch, which runs in a bath of oil.

Driven off the timing gear is the Berling magneto, and on its shaft is a belt pulley driving the Splitdorf dynamo, carried under the forward end of the tank on the near side of the machine and fastened to the secondary frame tube by means of a clip. On the opposite side is the Klaxon horn.

An excellent head lamp and tail light are provided, while the battery case is carried under the saddle and behind the carburetter.

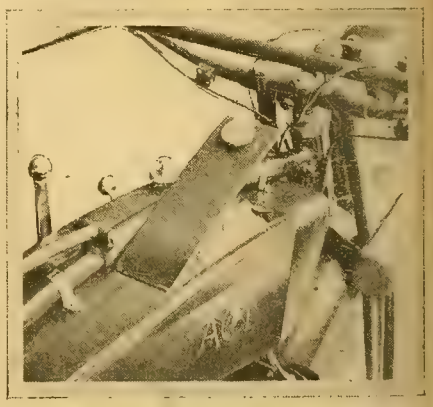
Usual American practice is followed as regards the clutch and change-speed lever, which are interlocking—that is to say, unless the clutch is withdrawn the gears cannot be changed.

Control Mechanism.

The brakes are of the external contracting pattern, one operating by a heel pedal on the near side and the other by a pedal on the off side, while the clutch may be actuated either by foot or by hand.

An interesting feature is the petrol tank, which holds four American gallons.

The front forks are of substantial construction, and follow lines somewhat like those of the 1914 Henderson. Lugs are provided for the attachment of a sidecar.



A tool box is carried in a recessed portion of the petrol tank.

QUESTIONS AND REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not **must be accompanied by a 2d. stamped addressed envelope for reply.** Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Tax on Light Four-wheeler.

I am going to build a small four-wheeled monocar weighing under 200 lb., and should be glad of your advice regarding taxation. Under the new system, should I have to pay a car tax, or would it come under the class of lightweight motor cycles?—A.E.B.F.

ny vehicle with four wheels (not being i the nature of an invalid's carriage) mes under car taxation, irrespective of igine size or weight.

Time Limit for Legal Action.

I had the misfortune of being in a collision recently, and was notified five weeks later that the other party was going to hold me responsible for the damage. The question I wish to ask you is whether I should not have been notified before this time had elapsed, as I have been given to understand that a claim cannot be made after fourteen days.—A.G.E.

claim can be made against you, notithstanding the fact that you did not ceive notification until five weeks after ie event. As a matter of fact, an action ay be brought within six years, but ıy unreasonable delay in making the aim would certainly not help the aintiff.

Knocking and Gear Slip.

(1.) My 1919 Scott has always slipped on high gear when climbing anything like a steep hill, whether I hold my foot on high gear pedal or not, but it grips again on the level; what can I do to remedy this, please? (2.) Also when I open out on to third jet a knocking occurs. What would this be, do you think? My high gear chain is loose, but not the low one, and I have fitted a new high gear chain, this is also loose, but not loose enough to get a half link out. The machine has only run about 700 miles, and I have been most careful in my driving.—W.T.O.

(1.) Gear slipping on the Scott machine may be due to one or other of these causes—insufficient grip on the friction band of the outer quick thread drum which is attached to the control pedal; excess of oil on the expanding band; wear of the expanding band and gear drum, or wear of the rollers which expand the gear band. As your machine has only done 700 miles, wear should not have taken place. Try the effect of tightening the friction grip band on the outer worm drum, and if this does not cure the trouble, inject petrol through the small holes which you will find in the periphery of the high gear drum. (2.) The knocking may be caused by the main jet being too small, also the ignition may be slightly too far advanced. A slack high gear chain also tends to cause harsh running, but here again a new chain should not yet be necessary; (we have obtained slightly more than 4,000 miles out of one of these high gear chains before a renewal was necessary). Knocking on full throttle may also be caused by the sparking plugs becoming overheated; perhaps those fitted on your machine are not suitable, and it might be advisable to change them.

READER'S REPLY.

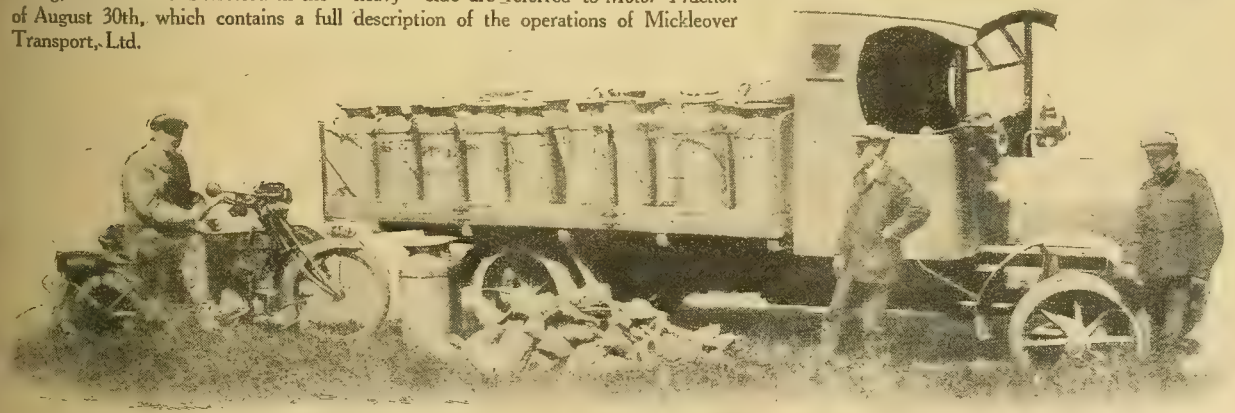
Defective Drip Feed.

In the issue of *The Motor Cycle* for the 19th of August, you reply to "B.W." about a defective drip feed. The trouble is a defective ball valve entering the crank case, the spring not holding the ball in place at top. I have had the same trouble. I do not think it is the ball valve between the oil pump and drip feed sight body, as the oil gets into the body but not down the pipe.—R.M.B.

I am a B.S.A. owner and have had the same trouble as "B.W." with the drip. I listened to the various ideas about the pen steel disc, etc., but found out myself, after having considerable trouble, that the complete cure was to tighten up the gland nut of the regulating screw. All other joints should be airtight.—SCOTTIE.

THE SIDECAR OUTFIT IN BUSINESS.

One of the New Imperial machines used by the depôt engineers of Mickleover Transport, Ltd., for keeping in touch with the work of lorries on the road. The company named run 300 lorries in different parts of the country, and they collect 150,000 gallons of milk daily for United Dairies, Ltd. Like the lorries, the sidecar machines are on the road every day whatever the weather may be, and we understand that they are giving every satisfaction. The work of organising such a big fleet to give economical results is a big undertaking, and readers interested in the "heavy" side are referred to *Motor Traction* of August 30th, which contains a full description of the operations of Mickleover Transport, Ltd.



THE A.C.U. SIX DAYS TRIALS.

A Memorable Test over the Yorkshire Moors. The A.C.U. and its Much Criticised "Freak" Hill Policy. A Day-to-day Description of the Incidents.

Miles and miles of Yorkshire moors were included in last week's Six Days Trials route. Some of the surfaces were grass grown, and had borne no vehicle for months past. A general view of The Stake, 1,700ft. up, showing R. Charlesworth (8 Zenith sc.) and S. Hall (10 Morgan).

MONDAY'S RUN, 161½ Miles.

Route: Darlington, Croft, Great Smeaton, Northallerton, Bedale, Masham, Kirkby Malzeard, Pateley Bridge, Blubberhouses, Otley, Guiseley, Bingley, Ilkley (lunch), Bolton Abbey, Grassington, Kettlewell, Carlton, West Witton, Thoralby, Redmire, Richmond, Middleton Tyas, Croft, Darlington.

Test Hill: Park Rash.

AS recorded in last week's issue, 133 competitors started from Darlington on the first day of the A.C.U. big trial. Those mentioned included thirty-eight on passenger machines and ninety-five who were riding solo. An analysis of the starters showed that the various classes had received support as follows: Lightweights up to 275 c.c., fourteen; up to 350 c.c., seventeen; solo machines of 500 c.c., twenty-five; 750 c.c., thirty-six; and 1,000 c.c., three. Among the passenger machines there were three with engines under 500 c.c., eleven 750 c.c., and twenty-one 1,000 c.c.; in addition there were three Morgans with engines slightly over 1,000 c.c.

Perfect weather greeted the start, the week-end's rain having laid the dust, whilst a cold wind had dried off all the grease, and the absence of sun suggested that the A.C.U. would have less cause to criticise air-cooling than in 1919.

Alec Ross called each man's number 15m. before he was due to start, and he was then allowed to enter the official garage and ride off to the quiet street in which the men were marshalled for the formal start. The first forty solo men had sidecars brigaded with them, so to speak, an arrangement which was later to prove catastrophic, as it led to serious baulking on Park Rash after lunch. Thus, Nos. 1 (Radco-solo) and 101 (A.B.C. sidecar) started simultaneously, and so on.

The first forty miles inspired incredulity in the competitors' minds. The surfaces were uniformly excellent. There were no hills. The route would have been dull to a degree if there had been no scenery to gaze at. A pack of foxhounds and a somewhat resentful bull provided the only relief from the tedium of reeling off level miles at rather less than legal limit. The steep rough descent of Old Church Bank into Pateley Bridge suggested that the leopard does not change his spots, and that the A.C.U. would shortly revert to its old policy of trying to smash machines.

Harper Dyke, on the far side of Pateley Bridge, proved to be an observed hill; but the 500 c.c. solo machines mostly tackled it on middle gear, so that anybody who lost marks on it richly deserved to do so. A mile or two over the crest came the only time check which we noticed all morning. The timekeepers' car was ingeniously concealed inside a huge barn.

Presently the road surfaces became more worthy of the A.C.U. reputation. Pot-holed macadam is good going compared to roads made of enormous setts, patches of which have subsided a foot or so. Fork springs could be heard clashing up solid.

THE TRIAL IN A NUTSHELL.

DISTANCE 918¼ miles (Aug. 23rd to 28th).

NUMBER OF STARTERS 133 (38 solo, 95 sidecar).

FOUR DAYS over Yorkshire Moors.

ONE DAY down centre of England.

LAST DAY at Brooklands for Speed and Brake Tests and Final Examination.

Forty manufacturers represented.

he A.C.U. Six Days Trials.—

Crossing the moors from Bingley to Ilkley we descended two of Friday's hills —Thwaites Brow, a paved corkscrew of 1 in 5, which would be formidably slippery in rain, and Keighley Gate—rough, but not frightful. Naked rocks jutting up through the moorland road threw several men off, and gave us all a rare jolting.

Lunch was taken at the Middleton Hotel, Ilkley, and meanwhile motorists from all over the North of England were streaming towards Park Rash—the titbit of the day's run.

A nasty little climb out of Kettlewell brought the riders into a grassy lane, bordered with innumerable cars and cycles, and at the end of a mile a paralysing spectacle burst upon their gaze. A steep hillside formed a natural grand stand for hundreds of spectators, round whom an apparently vertical scree of sand and loose stones curved away in a blind corner. The gradient is possibly 1 in 4, but the surface constitutes the real difficulty, steering being the problem for solo men, whilst tyre adhesion is the crux for sidecarists. As the event proved, any good solo rider who takes the left-hand side steadily ought to make a clean ascent; but sidecars can only get tyre grip by going up on the extreme right, and then the trouble is to keep up speed enough to get good steering.

The opening performances were poor, since the judge's car blocked the left-hand side for solo men, and some of the sidecar men were foolish enough to tackle the loose stuff in the road centre.

The first few men, both solos and sidecars, all failed, and just when the spectators had begun to denounce the hill as unclimbable, "Pa" Applebee made the first clean ascent, though his little Levis was jolted all over the road by the stones.

The big single two-stroke Dunelt sidecar on the grassy slope known as Beatgate Bank, Feetham. Summer Lodge, which caused so many failures, is among the range of hills in the background.

Noticeably good climbs were made by Kuhn and Porter (Levis), Goodman and Denley (Velocette), Kershaw (Verus), and Clarke (Coulson) in the lightweight classes.

Sam Wright's Humber was the first sidecar to make the hill look possible for three-wheelers, and Packman put up an equally good show with his Matchless. Stobart did even better by bringing his James up with the passenger seated instead of bouncing on the carrier. Nott was baulked. Colver's gear lever was jolted into neutral. Mrs. Hardee provided a touch of humour by helping to push her husband's outfit up. Smith's Enfield and sidecar turned a complete circle and ran over a boy seated by the roadside, which shows how the surface flung the outfits about. Hall's was the only Morgan to conquer the hill, but Boddington looked like making a clean climb when his chain broke.

Opinions differed as to whether F. Turvey (B.S.A.) or Capt. Wood (Scott) made the finest showing on a solo machine. For team work the Scott, N.U.T., 5 Rover, Sunbeam and Triumph all made excellent impressions, but the baby machines certainly had the toughest task amongst the soloists.

At night the judges wisely decided to ignore all failures on the hill and to award five bonus marks for clean ascents.

The route home included grass fields minus a track, each rider taking his own line to a gap in the far wall. Such gaps often embody a stone step so high that crank cases may foul it.

From top to bottom Park Rash is nearly three miles long, and in some cases early failures were repeated higher up.

This picture conveys some idea of the crowd which assembled on the lower reaches of Park Rash, near Kettlewell. The competitor seen ascending is F. G. Boddington (10 Morgan).

TUESDAY, 165½ Miles.

Route: Darlington, Reeth, Feetham, Hawes, Dent, Ingleton (lunch), Clapham, Stainforth, Langcliffe, Arncliffe, Kettlewell, Buckden, Stalling Busk, Bainbridge, Askrigg, Redmire, Richmond, Middleton Tyas, Croft, Darlington.

Test Hills: Summer Lodge, Buttertubs Pass, White Shaw Moss, The Stake.

After yesterday's sample of a real Yorkshire hill, competitors were highly expectant this morning when they set out *via* Reeth. There was a succession of short and sharp rises among the Pennines. Swaledale was followed as far as Crackpot, and then came a fearsome hill known as Summer Lodge, which unseated nearly every competitor.

Some had the power, but were hopelessly baulked again by the sidecars, which in one case stopped in a group with a Morgan broadside across the narrow road. The surface of this hill was described by Darnton, the Powerplus Indian rider, as a combination of a ploughed field and the Brighton beach, but the several twists were only just wide enough for a sidecar machine, so that passing was next to impossible. Brandish (Rover), Pa Applebee (Levis), Turvey (B.S.A.), D. Alexander (Enfield sc.), and S. Wright (Humber sc.), were among the ten or a dozen who claimed clean ascents.

On to Askrigg Hill, not quite so bad, there was a bad corner on joining the Muker road after the descent of Satron side. Then to Feetham there was a sharp rise, grass-grown, resembling the roof of a house, known as Beatgate Bank, leading to Barnard Castle. Most competitors got up comfortably despite the stones and a flock of sheep, which gave the photographers their opportunity. It was noticed how well the lightweights kept a straight course, and how agile the sidecar passengers had already become in scrambling on to the carriers. The Dunelt two-strokes are already notable for splendid climbing abilities, and the Velocettes were showing up magnificently among the lightweights. On to Arkengarthdale Moor, over the Buttertubs Pass, to the Wensleydale side, some of the riders were beginning to look crestfallen, knowing that White Shaw Moss still required attention before lunch at Ingleton. Rumours of the withdrawal of the Clyno entrants (later confirmed), owing to the "unreasonable conditions," were abroad at Buttertubs. Here, at the 220th mile, there was a secret check.

The hairpin bend at the top of the steepest stretch on Park Rash. C. Moser (4 Triumph) is seen after successfully negotiating the single figure gradient. In the right-hand top corner the approach to the hill from Kettlewell will be observed.

On Buttertubs Pass.

E. E. Palmer (3 A.B.C. sc.) led the way, and made light of the hill. This rider's showing on the steep gradients is so far a revelation. He was followed by Handley (O.K.), Jones (Velocette), Hall (O.K.), and Baxter (Radco), and all got up splendidly. Colver (Matchless) left the change down very late, and nearly spoiled his ascent. The Morgans were fast, the Scotts glided up, the Zeniths roared up, the Triumphs went up as good Triumphs usually do, and the Nut-Jap riders to a man were good. Ryecroft hit a boulder, which lifted his machine clear of the ground.

In the middle of the Pass there is a slight descent before the culminating stretch of 1 in 4½ and the usual stony surface. We passed here Sawer (Norton sc.) with a stripped low gear pinion—

A SCENE ON PARK RASH.
The sidecarist is O. Wade (6 A.J.S.), and the solo rider B. Kershaw (2¾ Verus-Blackburne).

Notwithstanding the severity of the course, many competitors were able to get ahead of time, which necessitated a halt to avoid being caught at the secret checks. D. Robb (3½ N.U.T.) is seen passing G. A. Strange (3½ James) and W. G. Harrison (3½ Sunbeam) near Reeth.

hard luck indeed, for Sawer's hill-climbing has won him the respect of all his fellow competitors. Frank Applebee (A.B.C.) was very fast, Knowles (Hobart) had the bad luck to break his belt on the hill when already 50m. late, Sullivan (4 Harley-Davidson) stopped momentarily through mulling the gear change, whilst all the A.J.S. sidecars did excellently. Darnton on his red Indian—which he affectionately calls his "Fire Engine"—streaked up the gradient. Turvey and Co. on the B.S.A.'s simply toured up. Douglas Alexander (Enfield)—probably the fastest sidecarist—added one more hill to his bag.

The "Strike" Hill of 1913.

White Shaw Moss is a long, rough hill, compounded of turf and boulders, with two bad knuckles, of which the worse comes at the very foot—a sharp bend covered with loose stones, and utterly devoid of any decent track. A narrow strip of hard stuff on the right soon terminates in a jutting ledge of rock, which caused worse wobbles than the loose stuff in the centre. There were, of course, innumerable failures, and all the passenger machines had an anxious time; not a few solo riders fell, charged walls or ditches, or even swung right round and began to go down again. The lightweights, as usual, were flung here, there, and everywhere, but Jones (Velocette) and Kuhn (Levis) made fine ascents, whilst Denley and Goodman actually waggled their Velocettes through a tangle of stranded sidecars on the very worst pitch. Newman on the little New Imperial and Clark on the Coulson lived up to their Park Rash reputation. Kershaw on a Verus was good, but Pa Applebee took a heavy fall. Price on the Diamond and Wills on a Verus were astonishingly fast for their power. The sidecar drivers were all in a cleft stick. If they came up slowly they lost steering way—a catastrophe which befell many. If they came up fast, their back wheels spun. Eric Williams made the first clean sidecar climb with his passenger on the carrier. Sam Wright brought the Humber up fast, but a gigantic skid brought his sidecar into the wall with a thud. Packman came up finely, as did Nott and Ross (both are experts at throttle work coupled with scientific bouncing)—a fine show for Matchless machines. Ashley on the L.M.C. sc. was also good, but nobody bettered Smith's 8 h.p. Enfield outfit, which was extremely fast. H. F. S. Morgan bounced his reluctant back tyre into biting the stones, and got up well. F. James's Morgan did not arrive till the surface had been cut to ribbons, but he got up; and Hall's Morgan made a most spectacular dive between two stranded bicycles, and scored a good climb. Douglas Alexander (Enfield sc.) dispensed with bumping, and his passenger remained in the sidecar. Capt. Charlesworth was faster, but his passenger was on the carrier, bouncing in unison with the driver. Foster's Dot-Jap made a similar ascent.

The heavier solo machines scored many first rate climbs. The Sunbeam crowd were particularly impressive, especially Dance. Mrs. Knowles (Norton) made a lovely climb, as steady as if she had been on macadam. Longman on the Ariel was cool and masterful. Three P. and M.'s conked out in a heap. Wood and Langman on Scotts were superb, as was Davidson on the Harley-Davidson. The Triumphs came up confidently in a cluster, Green and Edmond a foot apart shouldering each other like lovebirds. Chambers on the Zenith, was a sensible climb—slow and sure. By contrast Gayford, on a sister machine, came up far too fast, turned a complete circle, and went on just as though the feat had been intentional.

The Stake on Tuesday Afternoon.

After lunch at Ingleton, Kidstones Pass, succeeded by a further climb known as The Stake, unseated a number of riders on the homeward run. Near the top there are two turns, many stones, and the usual slippery stretches of grass. P. W. Bischoff was a spectator and announced the decision to withdraw the Clyno entrants. Major Watling pronounced the course thus far as more difficult than the Scottish Trials.

No. 1 (Baxter), clad in his familiar aluminium coat, led on the Radco, W. Cooper, who is verifying the course on his Morris Cowley light car, having passed

S. Wright (4½ h.p. air-cooled Humber sidecar) after having conquered the most difficult section of Park Rash; for this performance he was applauded by the many spectators.

The A.C.U. Six Days Trials.—

a few minutes earlier, and incidentally received a cheer from the many Yorkshiremen present for a very neat ascent. Pehrson (Dunelt sc.) had to be assisted due to wheel slip. F. W. Applebee (Levis) when going gamely hit a huge boulder, which diverted his front wheel up a steep grass bank which he mounted like a sheep on a wall, high and dry. He gamely went on again. Jones (Velocette) used his foot merely to keep upright. Davies (A.J.S. sc.) was very good; also Eric and Cyril Williams on similar machines. Hall (O.K.) was very good; also Lidstone (James), Hanks (Enfield), Denley and Goodman (Velocettes), Porter and Kuhn (Levises).

Now Mr. Alfred Scott demonstrated the hill-climbing powers of his new Sociable, which buzzed away merrily up the hill. Cocks and Bees on their two-

TWO OF TUESDAY'S HILLS.
(Left) Buttertubs. F. J. Fieldhouse (3½ N.U.T.) (Right) The Stake. A Morgan and a Zenith sidecar, the latter driven by Capt. R. Charlesworth.

stroke Beardmore-Precisions showed up well. Price (Diamond) travelled well, though he got in a rut and was thrown on the descent of the other side to Bainbridge. Robinson (A.B.C.) made a clean ascent, and in fact the majority of the solo mounts which showed up conspicuously on other hills. But ill luck awaited many of the sidecar men, who had proved themselves well able to account for sheer gradient, for a wet grassy patch on the very summit stopped quite a dozen sidecarists through sheer inability to get a wheel grip. Just above this stretch Dr. Low's Audiometer was in operation—quite the last straw to many enraged riders!—but, of course, many wily men who detected the instrument simply dropped into low gear and closed their throttles to minimise the effect! A cinema man completed the fare provided at The Stake. Strange (James), who has been doing well, suffered a fall on the descent to Bainbridge over a grass track with a very uneven surface. Newman did not arrive on his new Imperial, due, it was discovered later, to a seized gear box near Arncliffe. Boddington (Morgan) was delayed by a puncture.

Some are Happy!

Homeward there was nothing to trouble the riders further on this memorable day, for Darnbrook was dry, otherwise ——! The stony ascent in Richmond provided no excitement but continual bumps for the machines, one or two of which had lost their silencers, or part of them, by this time. We rode with a group of fourteen men homewards, one D. A. Atkin on a twin Rover, actually describing his experience so far as "topping." The Ariel riders were members of the party, happy as usual, but short of Watson whose engine seized and caused his withdrawal

Monday's retirements included:
H. Gibson (2½ Clyno), C. B. Redrup (2¾ Redrup), D. Read (2¾ Ready), R. M. Knowles (3½ Norton), G. W. Ellis (4 Norton), G. W. Lush (3 A.B.C. sc.), and L. G. Bachelier (8 Blackburne sc.).

On Tuesday the following retired:
P. W. Bischoff (2½ Clyno), B. Gold (2¾ Wolf), J. A. Newman (2¾ New Imperial), N. A. Woolley (2¾ Redrup), W. J. Lake (2¾ A.J.S.), D. L. Greig (3½ Sunbeam), W. J. Montgomery (5-6 Rover sc.), S. Sawer (4 Norton sc.), F. J. Watson (6 Ariel sc.), J. H. Place (8 Dot-Jap), H. E. Ashley (6 L.M.C. sc.), A. F. Knight (8 Clyno sc.), H. Reed (8 Dot-Jap sc.), and F. G. Boddington (10 Morgan).

WEDNESDAY'S RUN, 134½ Miles.

Route: Darlington, Stockton-on-Tees, Guisborough, Castleton, Hutton-le-Hole, Kirby Moorside, Lawton, Helmsley, Kilburn, Bagby, Thirsk (lunch), Felix Kirk, Hornby, Swainby, Carlton, Ingleby Greenhow, Stokesley, Craythorne, Yarm, Darlington.

Another fine day, and an easy route. The original programme included Rosedale Abbey Bank, reputed to be the worst on the entire course, but the stewards wisely decided to substitute a switch road, as the July rains were said to have washed the filling out of the gulleys, and there was some risk of broken crank cases. Crowds of Northern motorists had flocked to Rosedale, and the change of route caused them great disappointment, which the more sporting competitors unquestionably shared. After lunch, there were a few gentle hills, of which Boltby could claim mild difficulties; a good deal of roughish going; lots of fine scenery; and a regular series of watersplashes, several of which were quite sporting.

The only incident worthy of record before lunch was W. H. Wells's astute placing of the secret check. He found a smooth switchback over a lofty moor, and hid just behind the crest of a hump, which a preceding dip tempted us all to rush. Some of the boys were too smart for him even then: they had noticed that these checks generally occurred near one of the A.C.U. "twenty-mile" boards, one of which was just about due. So

The lower reaches of Buttertubs Pass, showing T. J. Ross (7 Matchless sidecar), Norman Rycroft (4 Triumph), and in the background W. A. Fell Smith (8 Blackburne sc.)

W.H.W. did not catch as many men as he expected.

The little market town of Thirsk was crowded, its great square forming a fine park for spectator's machines. After lunch there was a general rush to Boltby hill, which drew a huge crowd. It is quite a fair test, the main difficulties consisting of a stony centre and deep cross gulleys, whilst a watersplash 100 yards from the foot did not please the belt-drivers. Failures were few, being practically confined to the weaker lightweights and to passenger machines which encountered tyre stop. Particularly fine ascents were registered by Clark's Coulson, Wills's Verus, and Hanks's Enfield amongst the lightweights, and in the passenger class by Wright's Humber, Stobart's James, Bladder's New Imperial (his passenger remaining seated all the way up), and both Enfields. The big Enfield combination answers its helm with quite remarkable accuracy in what a golfer would term "the rough." Morgan roared up very comfortably indeed.

An Aquatic Afternoon.

The later hills were of no special account, but an insignificant incline becomes formidable when preceded by a watersplash, and we quite lost count of the fords along this section. Hawmby Beck was perhaps the worst, and Edwards (B.S.A.) found a deep hole in it and fell very heavily. Sheep Wash near Scarth Nick would be frightful in the reverse direction, but the trial came down the steep side, and it gave the men no real trouble. Several men had plugs put out of action, and Mrs. Knowles got water in her magneto, and had to blind in order to save her time marks. It is generally supposed that splashes are included only to test belts; so it is worth putting on record that they detect weaknesses in ignition, both as regards construction and location. Several of the splashes were officially observed.

Big Two-strokes making Good.

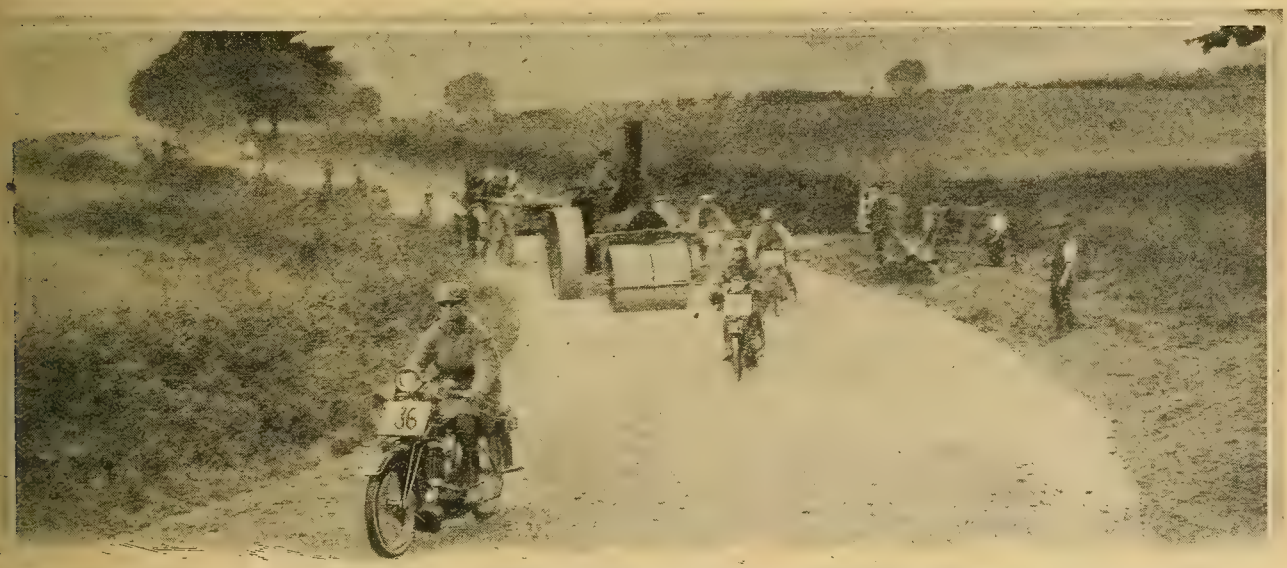
The two Dunelt two-strokes were still going strong, but the sidecar machine was handicapped by having a too high gear. Pehrson's bottom gear was only 12 to 1—rather high for a 500 c.c. outfit. One competitor suggested that the 1921 trials should be held in Lincolnshire in order to avoid so many "nasty" hills.

Westwood Wills rode the last twenty-one miles into Darlington on the rim. He "never mends punctures," his stock of spare tubes was exhausted, and the deflated cover refused to stay on the rim.

Lidstone, on the James, had trouble at a splash owing to the water dragging his coat into the naked magneto chain, but he managed to get going again.

Some of the old hands always dismount and examine a splash before entering it. There were horrid rumours of a ford which was paved with green slime, so that no solo machine could cross it erect.

After this day's easy run some of the more ardent spirits were pining for more hills to conquer.



Park Rash and Summer Lodge had prepared the competitors for anything in the way of surfaces. Here are seen two Sunbeam riders, G. Dance and F. C. Townsend, traversing a section of highway under repair.

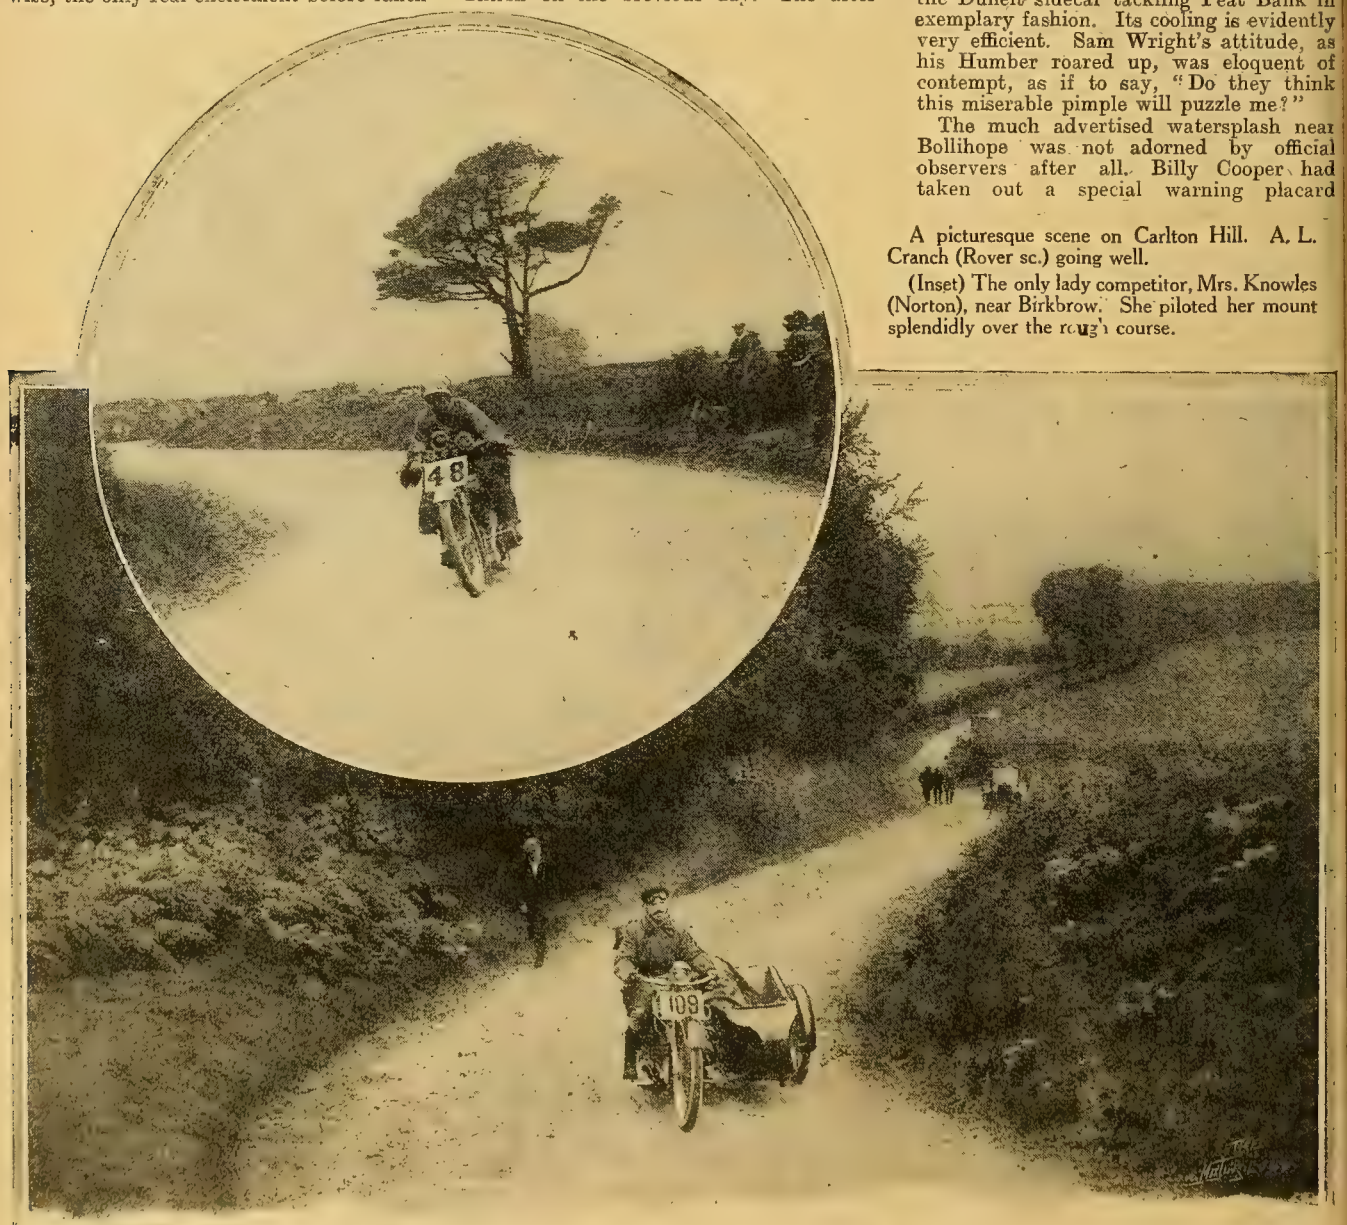
THURSDAY'S RUN, 160½ Miles.

Route: Darlington, Staindrop, Egglestone, Mickleton, Brough, Kirkby Stephen, Soulby, Crosby, Ravensworth, Shap, Clifton, Penrith (lunch), Langworthy, Melmerby, Alston, Nenthead, St. John's Chapel, Westgate, Bolt's Burn, Wolsingham, Tow Law, Crook, Bishop Auckland, Darlington.

A fine day again, and easy roads. Much of the route lay over main roads of excellent surface, so that the men were able to enjoy many gorgeous panoramas of dale and heather. Dust has begun to be mildly troublesome, and the roads were choked with clouds of it immediately after breakfast, when a few men took advantage of the good going to blind ahead and gain time to change tyres. Several of the passenger machines were thus engaged, and in the preliminary sprint they raised the road surface almost sky high. Otherwise, the only real excitement before lunch was a gem of a watersplash. Mercifully, for the sake of the competitors, it was not observed by any official, for only 5% of the men got through without trouble. It was particularly deceptive. The canny men prospected on foot, and seeing only 8in. of water charged ahead. Unfortunately, the bottom was soft mud and very deep. Some fell in the stream, others stuck fast in a vertical position, and many got their magnetos or carburetters (or both) full of water. Loud were the curses when the unfortunates discovered there was no A.C.U. observer in the crowd, so that all the solo machines might have utilised the narrow footbridge. At one time two Morgans lay cheek by jowl in the stream, completely blocking the passage, and later on the correspondent of a well-known daily paper stuck fast, and, refusing to wet his feet, waited until a horse was fetched to tow his car out.

Spectators at Penrith—the luncheon stop—were far less numerous than at Thirsk on the previous day. The afternoon run commenced with the long climb up to Alston, the highest town in England. This was a top gear run for most men, and the fine surface allowed us to enjoy the view which embraces four counties. After ascending Kilhope we were despatched on various excursions up byroads into the wilderness, but the going on the narrow tracks was uniformly hard, and the gradients, if sharp, were usually short. Lots of little hills had to be tackled, of which Peat Bank and Suffley Bank had attracted a lot of spectators. Most 500 c.c. solo machines tackled these "banks" on second gear, unless an unexpected hairpin created the scare of five lost marks. Mrs. Knowles, who is eagerly awaited all along the course, missed a gear change on one of these climbs, but nobody yet knows whether this particular pitch was officially observed or not. The refusal of the A.C.U. to advertise the observed hills leads to a good deal of precautionary bottom gear work. We noticed the Dunelt sidecar tackling Peat Bank in exemplary fashion. Its cooling is evidently very efficient. Sam Wright's attitude, as his Humber roared up, was eloquent of contempt, as if to say, "Do they think this miserable pimple will puzzle me?"

The much advertised watersplash near Bollihope was not adorned by official observers after all. Billy Cooper had taken out a special warning placard



A picturesque scene on Carlton Hill. A. L. Cranch (Rover sc.) going well.

(Inset) The only lady competitor, Mrs. Knowles (Norton), near Birkbrow. She piloted her mount splendidly over the rough course.

Two spring-framed machines, a Matchless sidecar and an A.B.C., on Thwaites Brow, near Keighley—a paved hill with five hairpins, and a gradient of 1 in 5.

'Dangerous Watersplash—Slippery Bot-om," but instead of the expected 2ft. a nere 4in. of water was trickling lazily over the not very slimy stones. Many riders had got such wind up about this splash that they deliberately took the ootbridge, though they thought the splash was "observed," preferring to ose marks rather than risk their machines. The "clever" brigade first searched the knot of bystanders for a man with a brassard, and then took the bridge. Even then Nemesis overtook them, for there was a 9in. drop off the end of the bridge.

One of the James brothers, on a Morgan, has had a curious experience. The driver's story is that he stuck on Summer Lodge on Tuesday and blocked the road in his efforts to avoid running back. The marshals asked him to get aside, and let the solo machines up, guaranteeing that he should be given a time allowance for the courtesy. He clocked in very late, as the marshals failed to return and assist his restart, as arranged. He was allowed to start on Wednesday, and again this morning, but the officials wired to Penrith for him to surrender his numbers at luncheon to-day, which he accordingly did. His brother broke a cam lever, and was towed into Penrith.

For some mysterious reason this afternoon's run concluded with nearly thirty miles of mining villages. Incredible pot-holes, innumerable children, and illimitable number of dogs infested the roadways. The riders were very fed up when they reached Darlington.

FRIDAY'S RUN, 204¼ Miles.

Route: Darlington, Catterick Bridge, Hunton, Middleham, Carlton, Kettlewell, Threshfield, Bolton Abbey, Ilkley, Brighouse, Huddersfield (lunch), Glossop, Buxton, Ashbourne, Sudbury, Yoxall, Lichfield, Coleshill, Stonebridge, Kenilworth, Warwick, Leamington.

To the general relief, Friday opened fine, for the penultimate day's run is generally a teaser, and if rain and grease had been added to the horrors of our 200 miles this day there would have been many retirements. All the disagreeables came before lunch. They began with the grass and stones leading up to Park Rash from the reverse side. Then came the descent of that notorious hill—quite the fiercest of many very practical brake tests during the day. Mrs. Knowles confesses she would rather go up ten times than down once, and many of the men zigzagged to ease the gradient.

Last But Not Least.

There was a little good going into Ilkley, and towards the top of Keighley Gate a spell of horrors began. The climb out of Ilkley bothered nobody, but the moor road to Keighley consists of a series of pits and boulders, well calculated to smash up sidecars and buckle wheel rims. The *pavé* through Keighley is notorious. Thwaites Brow was dry, so there was no fear of skidding on this quaintly paved corkscrew, and the men romped up its easy incline. Then came the climax of the whole trial so far as discomfort and risk was concerned—Harden Bank. It is difficult to make this abominable hill live in cold print. It has no gradient worth mentioning, but its surface is simply indescribable. In lieu of the small loose stones which compose the surface of most rough hills, the reader must imagine innumerable big stones, deeply embedded in sandy soil, with long prism-shaped edges exposed. Many of them are a foot long, and protrude six inches. Here and there, particularly on the inside of the second bend, there are tremendous reefs of solid rock. One loose boulder lying in the fairway weighed a good 60 lb. A rider who knows the correct path up the hill can watch his front wheel and dodge the more violent collisions. A first timer must look ahead for the wisest track, and let his front wheel takes its punishment. Very few solo men got up without using their feet to correct wobbles. The passenger machines had little trouble until the middle of the first hairpin, which is a left-hand bend, got cut up into a morass. The crews for once had no need to bounce deliberately; the rocks saw to that part of the business.

Performances on Horden Bank.

Many fine ascents were made, nevertheless, and a big crowd of spectators thoroughly enjoyed the spectacle. Of the lightweights, Hanks (Royal Enfield), Kershaw (Verus), and Clark (Coulson), impressed us most. F. W. Applebee (Levis) got an ovation. Price (Diamond) was flung up the bank, but he never stopped his engine. He just let his machine slide back on to the road, let in his clutch again, and went happily on—a great stunt. Kershaw never took his feet off the rests—a very neat, clever climb. Baxter's Radco has been geared too high for some of the worse hills. Harden suited him, and he did excellently.

J. F. Lidstone (James) and Eric Williams (A.J.S.) passing through Alston, the highest town in England

C. P. Wood (Scott) on the extraordinary surface of Harden Bank, which resembles on some portions the set lava stream of a volcano.

Most of the passenger machines bounced masterfully up, having a hard bottom for their driving tyres. The Dunelt sc. did excellently for so small an engine. H. F. S. Morgan made a fearsome climb at speed, roaring and rolling. The bigger solo machines had the easiest task, as their weight and speed gave steady steering if they enhanced the personal misery. Frank Applebee (A.B.C.) shot up at a great rate with his feet on the rests. Dance (Sunbeam), of course, was fast. When we got on to a proper road again, we were in the manufacturing district. Everything was black and grimy, a dirty haze hung overhead, and the common objects of the roadside were dogs, children, trams, setts, wool lorries, and pot-holes as big as baths. But the road was wide, the police were encouraging, and there was a miniature T.T. along the streets of Brighouse and Huddersfield to lunch, where another vast crowd awaited us.

The Timed Hill-climb.

A very few miles of dirty streets sufficed to release us from Huddersfield and its horrors, and the sole incident of the afternoon was the timed climb up Holme Moss—a long, easy main road hill with a medium hairpin or two, and lots of spectators. No police were present, the road was open to ordinary traffic, and there was a mild procession of non-competing motors in both directions. For example, just as a Tin Lizzie was trying to overtake a 5-ton lorry on the worst hairpin two sidecar combinations (Sam Wright and Eric Williams) roared round neck and neck, and got thoroughly baulked. Again, when George Dance was roaring up to cut the hairpin, he met a big American twin coming down on the very angle of the bend. Of the baby two-strokes the Velocettes were clearly the fastest round the hairpin; the Blackburne engines of the Verus riders showed very healthy acceleration. The crowd were eagerly waiting for Mrs. Knowles, and she took her Norton up in most workmanlike fashion at a good bat. Seen at the top, Eric Williams (A.J.S.), Bladder (New Imperial), and Fell-Smith (Blackburne) were the most impressive sidecars on a fast straight. Of the rest the James and Velocette babies, with Wills's Verus, were very speedy, whilst Ryecroft (Triumph), Applebee (A.B.C.), and Morgan (Morgan) simply tore past us. When we had cleared the moors above the Woodhead reservoirs we got on to decent Midland roads, switchbacky to Ashbourne and flat through Staffordshire and Warwickshire. High speed was the order of the day. The fringe of spectators by the roadside gradually threatened to become all but continuous. The streets of Lichfield were full. At Coleshill the police had difficulty in keeping a narrow lane open for us to pass, and at Stonebridge every lover of motors in both Birmingham and Coventry had congregated. At Kenilworth the exigencies of hotel accommodation split the trial into two parties bound for Leamington and Warwick respectively. Had Mrs. Knowles's billet been in Coleshill, probably she would have gained a gold medal, for her performance was one of the best in the trial. Fate was against her, however, for in Berkswell a non-competitor emerging from a side road ran into her, with the result that she was rendered unconscious. Thus ended a tiring day.

THE LAST DAY, 113½ Miles. Total 918¼ Miles.

Route: Coleshill, Stonebridge, Kenilworth Warwick, Banbury, Oxford, Henley-on-Thames, Maidenhead, Windsor, Staines, Chertsey, Brooklands.

The last day. Main roads and no secret checks! What a relief to the tired survivors who set out from Coleshill on the last leg of the hardest trial that has ever been organised. The majority took it easy, but others availed themselves of the opportunity to get ahead in order to make adjustments and polish up their machines for the final examination. Toward the end brushes and petrol tins were a common sight. Whilst many machines appeared to be in as good condition as when they started, on passing some of the others we detected strange noises suggesting that the terrible gruelling had left its mark upon the mechanism. The A.J.S. sidecars were in splendid condition, the Triumphs and Scotts were burbling along, while the American representatives—Indian and Harley-Davidson solo models—were causing their riders no anxiety.

Stopped on the wayside we saw a few riders carrying out tyre repairs, and one or two changing covers in the sunshine among green fields. With only a few miles to go, a few punctures were not sufficient to damp the spirits of the unlucky ones, providing that they had sufficient time in hand.

The half-hour's speed-test on the track was a popular feature, and the competitors indulged in real speed work. P. Pehrson (Dunelt) demonstrated the speed of a big single two-stroke with a sidecar.

Near Oxford we came upon Mrs. Knowles, who was so keen to see the finish that, against the doctor's orders, she had accepted the pillion of Grieg's Sunbeam in order to get there. We took her aboard our passenger machine, and proceeded on our way, and shared in the very friendly ovations with which her fellow competitors greeted her. It was evident that they were greatly relieved to see her on the road, for alarming rumours had reached them in their billets in the various Midland towns where they had spent the night. In the 'Varsity city, goodly crowds collected to see the procession. Through Henley, Maidenhead, Windsor, and Staines, the run was just a tour, which would have been boring to the tired riders had not a "gold" been in sight.

Brooklands at last.

Just before two o'clock the leaders were turning into Brooklands race track. Round the bends and through the tunnel they came with smiling faces, then into the paddock to be parked while they had lunch.

Before the last man was in, the brake test had started on the test hill. To prove that one had perfect control over a machine in free engine on a 1 in 4 required an ability to balance at a snail's pace on the part of the solo riders. Only a small minority failed in the test. Knowles could not hold his Hobart, and the brakes on Charlesworth's Zenith were not quite sufficiently powerful to bring him to a stop.

Quite a number of brakes squeaked and squealed, but the great majority were silent. Alexander's Enfield had its wheel locked, and he slithered a little on his steel studs. Among the best performances we saw were Smith's Enfield sidecar, S. Hall's Morgan, de la Hay's Sunbeam, Robbs's N.U.T., Edwards's B.S.A., Strange's James, Batten's P. and M., Hardee's Matchless, White's and Danskin's Rovers, and Longman's Ariel.

Dr. A. M. Low was the judge for this event, and apparently he relied upon his own judgment instead of the watch. Most of the riders came down the hill at less than 1 m.p.h., hence the watch was useless, and Dr. Low, therefore, called upon them to increase speed, and then pull up.

Incidents of the Speed Test.

After this test, the competitors rode to the fork to start their speed test. Here again the regulations appear to have been altered, for although the programme stated that the test was to be for half an hour, the competitors received instruction cards upon which was stated the number of laps which had to be covered at a certain speed.

The table of results on pages 286-7 shows that only a few lost marks in this test. In fact many competitors seemed to cast caution to the winds and indulged in a real speed burst, covering their number of laps well within their time. A number of the competitors had never seen Brooklands, and to ride on it was to realise their dreams, and it says something for modern engines that they stood up to this open throttle treatment at the hands of those who had no previous experience on Brooklands, where an engine requires twice as much lubrication.

Fate had reserved a trick or two for a few unfortunates. The engine of Stobarts's James sidecar, which had done so splendidly during the trial, developed trouble, as did Kaye Don's Zenith. The former was towed in, and the latter did his required number of laps on one cylinder. F. A. Applebee (A.B.C.) actually ran out of petrol, and caused his father (the veteran F.W., or Pa, as he is familiarly known) some anxiety when he did not reappear. E. Redvers Johnson (4½ Humber) got into a speed wobble, and fell heavily, hurting his hands badly. Tonks (New Imperial) ran over a Cowey horn on the track and suffered a fall. Touring bars are not really suitable for track work. Sam Wright's Humber sidecar did all that was required, and he received many congratulations for bringing so small a sidecar through the trial.

THE WINNING SCOTT TEAM IN THE SIX DAYS TRIALS.

Left to right: W. L. Guy, Capt. C. P. Wood, and Geoffrey Hill. In each instance the machines have 3in. Palmer cord tyres, Amac carburetters, with W.S.R. jet adapters, which gave an average of 88 m.p.g., and K.L.G. plugs.

A.C.U. SIX DAYS TRIALS, 1920.

CENTRE: DARLINGTON.

PROVISIONAL RESULTS:—

133 Starters. 33 Retired. 88 Gold Medals. 5 Silver Medals. 1 Bronze Medal.
2 No Awards. 3 Disqualified. 1 Withdrawn.

Basis of Awards: marks credited at the start—200, made up as follows: Reliability 100, Hill-climbing 50, Braking 20, Condition at finish 20. Silence 10. To secure Gold Medals competitors in the respective classes had to obtain the following marks: Solo: 275 c.c., 150; 350 c.c. and 500 c.c., 175; 750 c.c. and 1000 c.c., 180; Sidecars: 500 c.c., 160; over 500 c.c., 175.

Reunion of 47th Division D.R.'s.

A meeting of D.R.'s who were with the 47th London Division Signal Co. is to be held on September 18th. All who desire to be there should write to Mr. J. C. Stuart Richardson, 8, Cemmaes Terrace, Hemel Hempstead, who will supply full particulars.

A.C.U. Midland Centre.

Delegates from eight clubs in the area of the proposed A.C.U. Midland Centre met in Birmingham recently. Maj. R. Vernon C. Brook was in the chair, and the following club delegates were present:

W. H. Egginton and E. W. Winckle (Birmingham M.C.C.), G. E. Roberts and J. F. Spencer (Coventry and Warwickshire M.C.), J. G. Nickson and W. H. Walker (Kidderminster M.C.C.), F. C. Dawes and F. J. Urry (M.C. and A.C.), H. S. Uzzell and H. Warden (S. Birmingham M.C.C.), S. F. Barnes and W. Douall (Stourbridge M.C.C.), W. Bishop and A. O. Haskins (Wolverhampton M.C.C.), J. Howell and J. A. Newman (Worcester and District M.C.C.).

The Centre also receives the support of the Nuneaton and District M.C.C., Redditch M.C.C., and the Sutton Coldfield and North Birmingham A.C. The Worcester club, however, through its delegates, stated that it wished to form a centre of its own, but after discussion it was decided that the time was not yet ripe for two centres within twenty-five miles of each other.

Mr. E. W. Winckle was elected secretary, and the Sutton Coldfield club was asked to nominate a member to act as treasurer.

The Late Mr. A. E. Walker.

We very much regret to have to announce the death of Mr. A. E. Walker, who was formerly designer to, and manager of, the motor cycle department of Messrs. Hobart, Bird, and Co., of Coventry. Mr. Walker was a brother of Miss May Walker, who is a frequent contributor of articles to this journal on motor cycle topics for ladies. The late Mr. Walker was in the A.S.C., M.T. during the war, and before and since he rode in numerous competitions, and gained three gold medals in three successive London to Edinburgh trials. It was after the last of these runs that he was taken seriously ill, and he never entirely recovered. Mr. Walker, who is brother of Mr. W. J. Walker, of St. Albans, a well-known builder of motor car bodies, and also an enthusiastic motor cyclist, was only twenty-nine years of age, and his death will be a sad shock to his many friends.

Surbiton Hill-climb.

On Saturday the 4th inst. a members' hill-climbing competition will be held on a gradient a mile outside Dorking. There are approximately eighty entries in the light classes. Prizes will be awarded for time and formula results.

Price of Petrol.

The opinions which were freely mooted at the time of the proposals to withdraw the tax on petrol are already being justified. On Monday last the announcement was made that spirit would be raised in price from sevenpence to elevenpence per gallon according to quality. No preliminary statement was made, and the new figures were charged at once. Benzole controlled by the petroleum companies has also been advanced by sevenpence per gallon. Such an unwarranted increase clearly shows how the future of the whole motoring movement is in the hands of a monopoly, and it is surely high time that the Government took steps to further the introduction of new, and the development of existing, home fuel supplies.

Singer take over Coventry Premier.

We are authoritatively informed that the Singer Co., Ltd., has purchased the entire undertaking of Coventry Premier, Ltd. The three-wheeled runabout will still be produced as heretofore under the name Coventry Premier, but the management will be under the control of the directors of the Singer Co. This new arrangement came into effect yesterday, the 1st inst.

The Scott Trial.

On Saturday many of the hills included in the recent Six Days Trials will be revisited by the competitors in the annual sporting event organised by the Scott Motor Cycle Co., Ltd. Instead of being given a 15 m.p.h. schedule over such sections as Park Rash, a speed of 20 m.p.h. must be maintained over a course which is infinitely worse.

Quite a sporting day is anticipated, as the event is one which appeals to those riders who enjoy rough country conditions. The start is from Otley, at 11 a.m., and the route is via Dob Park, Fewston, Blubberhouses, West End, Appletreewick, Grimwith Reservoir, Burnsall, Hebden, Coalgrove House, Grassington, Kilnsey, Malham Tarn, Darnbrook, Kettlewell, Park Rash, Carlton, The Scar, Pateley Bridge, Middletongue, Greehow, and Burnsall. The route can be followed easily on Sheet No. 6 of Bartholomew's "two-miles-to-the-inch" maps, and North Country riders should endeavour to see the fun at one or other of the points of interest.

The brake test in free engine on the 1 in 4 hill at Brooklands. F. J. Lidstone (2¼ James).

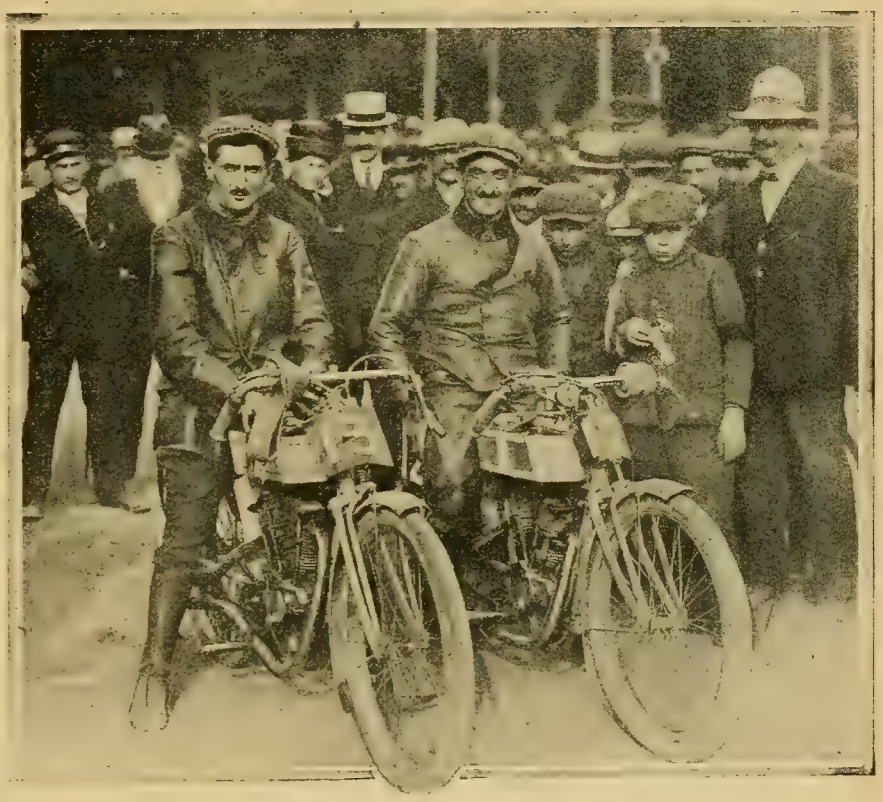
THE GRAND PRIX.

A Chapter of Accidents on the Circuit de la Sarthe at Le Mans. Only One Machine finishes in 500 c.c. Class.

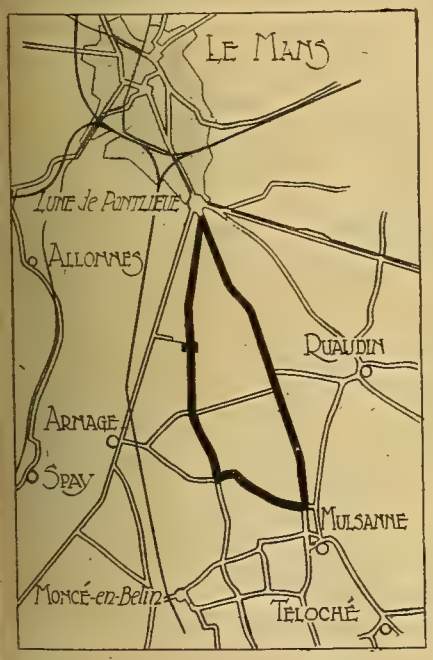
THE Grand Prix of the Union Motocycliste de France, held at Le Mans on Saturday last, was won (in the 500 c.c. class) by Jolly on an Alcyon, which covered the twenty-two laps (233 miles) in 5h. 16m. 13s. In the 350 c.c. class the winner was Bartlett, on a Verus, who covered twenty laps (212 miles) in the same time. The winner in the 250 c.c. class was Mourrier, on a Thomann two-stroke, which covered sixteen laps (170 miles) in 4h. 4m. 33s. Cleck, on a motosolo, took second place in 4h. 46m. 12s. No other machine finished the race within time allowance.

The course, which lies to the south of Le Mans, is triangular, and has a total length of about ten miles. Of the three classes, the 250 c.c. machines were required to make sixteen circuits (170 miles), the 350 c.c. machines twenty circuits (212 miles), and the 500 c.c. machines twenty-two circuits (234 miles), and the competitors were started in groups according to their classes, the smallest going away first at six o'clock, and other classes at intervals of one minute. In consequence, the start was a fine sight. Five minutes before his class was due to go Alexander, on one of new chain-driven Douglases, discovered a big nail in his rear tyre, and was left behind when his group started. He got away with a delay of about three minutes, but, riding magnificently, he got the lead after two laps.

Competition was very keen at the beginning of the race, particularly between the Peugeot, Alcyon, and Douglas teams; mechanical troubles, however, developed early. Devaux on a 3½ h.p. Peugeot, who had been in front on the first lap, broke his front fork, and had a bad spill, although he was not injured. After four laps, Péan, another Peugeot rider, who had been in second place, had to retire with a broken change speed gear, leaving only Perrin of this team in the race



Jolly, the winner of the 500 c.c. class in the Grand Prix. He rode an Alcyon, and is seen with his colleague, who rode a machine of the same make.



The Grand Prix course is a triangular circuit of about ten miles.

Franco-British Duel on Douglases.

For a considerable time there was a very keen contest between Jolly (Alcyon) and Alexander (Douglas), the latter's machine was slightly the faster, and kept the lead except for a short time after stopping to fill up. The Alcyon which got ahead then did not hold its advantage long, for Alexander again rode into first place, and after sixteen laps had a lead of about 20m. At this point, however, the second gear of the Douglas stripped, probably owing to the fact that these machines have no clutch. With this handicap, it was very difficult for Alexander to make hairpin turns, and after stalling on one corner he found it impossible to get away again unaided, and was ordered off the course after having been pushed. The machine had shown such remarkable speed and had been so well handled that this decision caused general regret.

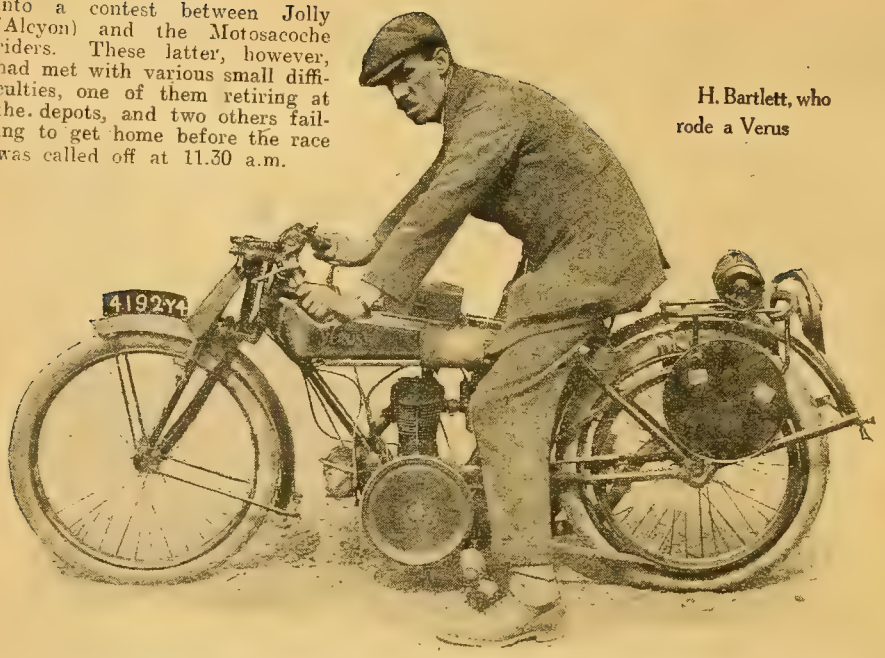
Kickham (Douglas) broke a valve early in the race, while Doisi, also on a Douglas, was held up at an early hour with stuck carburetter throttle, and later abandoned the race owing to a broken shock absorber. Of the three members of the A.B.C. team, only Borgotti covered the entire distance, but he came in one minute too late to get official recognition for the performance. Yenne fell, and Naas was eliminated by a flying stone from a competitor's machine, which broke his cylinder head and damaged a valve. Naas was also fined 100 francs for going round the course the wrong way. Vuillamy, on an Alcyon, abandoned the race at the replenishment pits, a statement being made that he was tired.

A New Vertical Twin.

The new Blériot machines, which appeared for the first time in a speed contest, met with ill luck. Paumier had to abandon very early with a broken clutch, Berlié broke his valve gear, and Brunet failed to finish within the time limit. The machines, while on the same general lines as stock Blériots, had special engines with two side-by-side cylinders having four overhead valves for each.

By reason of the mechanical accidents to Peugeot, Alcyon, and A.B.C. machines, the race resolved itself towards the end

into a contest between Jolly (Alcyon) and the Motosacoche riders. These latter, however, had met with various small difficulties, one of them retiring at the depots, and two others failing to get home before the race was called off at 11.30 a.m.



H. Bartlett, who rode a Verus

In the 350 c.c. class, the winner proved to be the Englishman, Bartlett, on a Verus machine. His companion, Copus, was put out with a broken gear box, while Lehmann, the only Alcyon rider in this class, had a nasty fall, due to a broken mudguard catching in the front wheel. Louis on the 250 c.c. Alcyon broke his rear mudguard stays, and fastened the wreckage on to the carrier; this being considered an infringement of the rules, he was disqualified.

This is the first time in the history of French motor cycle racing that only one machine out of nineteen finished in the 500 c.c. class. Such a result, however, may be attributed to the fact that the roads, while being very fast, had very rough surfaces, which were extremely destructive to machines.

The following is a list of machines which were entered, the driver's name being in parentheses:

250 c.c. CLASS.

Thomann (Marc).
Motosolo (Dubost).
Motosolo (Cleck).
Alcyon (Louis).

350 c.c. CLASS.

Alcyon (Lehmann).
Alcyon (Guiguet).

Douglas (Kickham).
Peugeot (L. Perrin).
Blériot (Paumier).

TWO-STROKE SUCCESS IN CYCLE CAR RACE.

Promptly at noon, or only half an hour after the motor cycle race finished, the Cycle Car Grand Prix began, competitors being sent away in pairs at intervals of 30s. There were fifteen starters, the Soriano and Automobilette teams failing to appear.

Violet, on the 10 h.p. Major, set a very fast pace, gaining nearly 2m. on his nearest competitor, Ware (Grand Prix Morgan), on the first lap. The latter machine was well handled, however, and, although it was never first, it made a very good impression until half-distance, when, on being stopped for overheating, water was put in while the engine was too hot, thus cracking a cylinder jacket. About the same time one of the chains had to be replaced, and, although the cracked jacket was patched up, the machine failed to show again its original speed, and never recovered its lost position.

The cycle car competitors were soon thinned out. Saindford, on the other Morgan, disappeared on his initial lap owing to magneto trouble. Fournier, on a machine of his own make, retired on his first lap, as did Lucien Noel (Noel), who broke a wheel. Jourdain (Jourdain) was ruled off the course about half-distance after having lost all mudguards. The Tom Pouce machine, driven by Coquillat, abandoned the race very early. Erders (Major) pulled a tyre off the rim when cornering, and, getting on to rough ground, broke the steering gear before half of the sixteen laps (170 miles) had been run.

The race became a contest between three or four machines. Violet, who was formerly of the Violet Bogey Co. and who is now responsible for the Major cycle car, got the lead and was never seriously challenged after the Morgan's trouble with the water jacket and replacement of chains. The latter machine had not finished when the race was called off. Violet's victory was somewhat easy, but is remarkable by reason of the fact that this is the first time that a two-stroke cycle car has beaten four strokes in open competition.

The engine on this machine has two cylinders, having a common combustion chamber. Crank case compression is employed, and admission is by one cylinder and exhaust through the other; it is declared that the engine develops 30 h.p. The fuel consumption was rather high, being between forty-five and fifty litres for the entire distance (170 miles).

Leveque (Ruby) finished second. An exciting incident in connection with this car occurred after stopping at the pits. The driver, not noticing that his mechanic had failed to get into the seat, started away, while the mechanic clung to the side, and was dragged along the ground twenty to thirty yards.

Hawkes, on a G.N., appeared to be holding his car in reserve, and ran with considerable regularity, but never showed great speed compared with the French machines, and when the race was called off at five o'clock he still had a lap to go. Blanc (Tom Pouce) was also running at the end.

There were two machines in the 750 class, but both came to the pits and retired before the end of the race.

The results were as follow: Violet (Major), 3h. 37m. 39s.; Leveque (Ruby), 3h. 48m. 27s.; Louis Noel (Noel), 4h. 32m. 3s. Ware (Morgan), Hawkes (G.N.), and Blanc (Tom Pouce) were all running when the race ended.

A scene during the weighing in of the Grand Prix machines

SAFETY

No. 10.
Motor Observation Mirror.
13/-

IS essential to real enjoyment in motor cycling not only safety itself, but an absolute feeling of security. Such a happy state of mind can only be enjoyed when the road ahead and movement to the rear are within your range of vision. No man can look two ways at once, and to turn back is dangerous; only one alternative presents itself—fit a "Clayrite" Mirror; it will enlarge your vision, save you turning to look back, and will add a pleasing appearance to your mount. Compared to the advantages the cost is trifling. Immediate delivery from your dealers or direct from us.

CLAYRITE

BECAUSE OF THEIR QUALITY

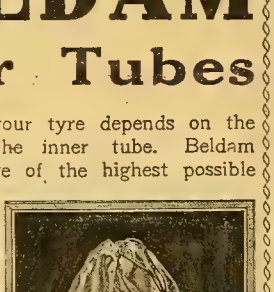
insist on

BELDAM

Inner Tubes

THE life of your tyre depends on the quality of the inner tube. Beldam Inner Tubes are of the highest possible quality. They are built up layer by layer from the finest sheet rubber. Beldam Tubes are extremely elastic, of great strength and toughness, and, if correctly fitted, will outlast your cover.

Get a Beldam InnerTube to-day and compare it with any others you are using. You will realise at once the superior quality of the Beldam and why it wears so long.



You get them in a Waterproof Bag

Every Beldam Tube is packed in a waterproof bag, which keeps it fresh and clean and free from damage until you want it.

All standard sizes made. Write for prices.

The Beldam Tyre Co. (1920) Ltd. Brentford, Mid'x.

Godbolds.

TRIUMPH T.T. Model, 1915; £55.—Brook Bros., Burnham-on-Sea. [3950

TRIUMPH 1920 4h.p. Model H., solo, in stock at makers' list price, £127/10.—Below.

TRIUMPH 4h.p., 3-speed countershaft, reconstructed model, just received from makers, guaranteed 3 months; £105.—Elce and Co., 15-16, Bishops-Av., Camomile St., E.C.3. [0068

TRIUMPH, 1915, and C.B. sidecar, perfect; £78.—109, St. Leonard's Rd., Mortlake. [5045

FOR Sale, Baby Triumph, 1918, excellent order; £60.—Maunder, 26, Highfield, Kendal. [4996

1919 Triumph, all accessories; £100; Yorkshire - Box 533, c/o *The Motor Cycle*. [X0148

JUNIOR Triumph, late 1918, very little used; £60.—Eagle House, Brislington, Bristol. [5010

2¼h.p. Baby Triumph 2-stroke, 1914; £55.—Wauchope's, 9, Shoe Lane, London. [2028

1919 Countershaft Triumph, splendid condition; £90.—Ross, 86, High Rd., Lee, S.E. [5078

3½h.p. Triumph, Bosch, B. and B., fine going order.—Double, Spencer's Wood, Reading. [5698

1919 Triumph Junior, all accessories, excellent condition; £60.—Cobby, Feltham, Begnor. [6118

4h.p. Countershaft Triumph, good condition; £80.—2, Fortune Gate Rd., Harlesden, N.W.10. [5801

TRIUMPH 4h.p., clutch model, good condition and order; 38 gns.—14, Arundel Rd., Croydon. [6235

TRIUMPH Model H 4h.p.; £127/10; brand new.—Norman Whitehouse, Bridgtown, Cannock. [X0191

TRIUMPH 1913 3½h.p., 3-speed, good order; offers.—Barber, The Cottage, Chelford, Cheshire. [5384

TRIUMPH 1920 Motor Cycles, at makers' prices - Wilkins, Simpson, opposite Olympia, London. [3813

COUNTERSHAFT Triumph, late model, fitted up; first cheque £105.—Box 7,380, c/o *The Motor Cycle*. [5085

1916 Triumph Countershaft and C.B. Sidecar, perfect; £95.—109, St. Leonard's Rd., Mortlake. [5045

3-SPEED Countershaft Triumph and Sidecar, lamps horn, etc.; £90.—H. Wright, Arlesey, Beds. [5531

TRIUMPH 2-stroke, 1920 model, brand new; £75.—J. E. Lawes, Ltd., The Triangle, Aldershot. [5288

3½h.p. Triumph, 1911, excellent engine, fast, reliable; £37/10.—Comber, Rodboro, Worthing. [5465

BABY Triumph, 1917, new condition, very little used; £55.—Secretary, Gas Company, Windsor. [6233

LATEST Triumph, brand new, unpacked; accept £125.—Elkington, 102, Queen's Rd., Peckham. [5912

4h.p. Triumph, countershaft model, fully equipped and perfect; £75.—Coffin, Holwell, Sherborne. [6082

WAUCHOPE'S, 9, Shoe Lane, London.—Renovated Triumph, countershaft gear and sidecar; £120. [6407

1919 Triumph, countershaft, engine No. 59250, fully equipped; £90.—37, Arlington Rd., Surbiton. [5782a

MOTOR CYCLES FOR SALE.

Triumph.

T.T. Triumph, late 1919, fully equipped, an exceptionally good engine; £95.—12, De Parys Av., Bedford. [5481

TRIUMPH 3½h.p., clutch, sidecar, lamps, horn, all spares; trial; £40.—Taunton, 17, Albion Grove, N.16. [5301

TRIUMPH 3½h.p., 3 speeds, perfect condition; £45.—Moffatt, 406, Garratt Lane, Earlsfield, S.W.18. [6270

TRIUMPH 4h.p., perfect condition, Dunlop heavy, Bosch, plated; £60; evenings.—119, Brecknock Rd., N.19. [5050

1913 Triumph Combination, 3-speed, clutch, good condition; offers.—149, Bolingbroke Rd., Stoke, Coventry. [5868

TRIUMPH Combination, C.B., lamps and horn, ex Triumph Co. 1920; £125.—21, Felix Av., Crouch End, N.8. [5990

TRIUMPH 4h.p., 1919, and sidecar, lamps and horn complete, in perfect order; £145.—Brook Bros., Burnham. [3948

TRIUMPH Junior, 1916, just overhauled, accessories; after 6; £58.—Roberts, 29, Clarendon Rd., Lewisham, S.E. [6012

1920 Triumph 4h.p., T.T., perfect running order, very little used; £100.—Pepper, 47, Abington St., Northampton. [5133

TRIUMPH 3½h.p., Grado gear, mechanical horn, powerful, just overhauled; £38.—58, Erlanger Rd., New Cross. [5673

1920 Triumph 4h.p., countershaft, lamps, horn, and accessories, complete; £125.—Checkley, 1, Lewis Rd., Coventry. [X0247

TRIUMPH 4h.p., countershaft, 1916, Sunbeam sidecar; £100.—Carter, 96, Merton Rd., Wandsworth, S.W. [5837

T.T. Triumph, unused 5 years, Bosch, grand condition; £33/10.—30, Mallinson Rd., Clapham Junction, S.W.11. [5534

TRIUMPH 3½h.p., 3-speed hub gear (just overhauled), clutch, excellent condition; £40.—31, Stockdale Rd., Battersea. [5318

1913 Triumph Coachbuilt Combination, 3-speed clutch, lamps, etc.; bargain, £54.—9, Isla Rd., Plumstead Common. [5517

TRIUMPH 3½h.p., clutch, adjustable pulley, Bosch, accessories; reasonable offer.—Billing, Main Gate, Arsenal, Woolwich. [5495

3½h.p. 1913 Triumph, 3 speeds, clutch, brand new engine, perfect; £60, offers.—Oswell, R.G.A., Shoreham-by-Sea. [6010

TRIUMPH 4h.p., brand new 1920, done 80 miles, perfect, unscratched; £116; no offers.—Box 527, c/o *The Motor Cycle*. [5145

TRIUMPH 3½h.p., T.T., guaranteed in perfect mechanical order; for quick sale, £35.—Seen at 135, Edgware Rd., W.2. [5261

TRIUMPH 1919, 3-speed countershaft (not W.D.), accessories, faultless condition; £100.—Hedger, 3, Cumberland Gate, Kew. [6110

TRIUMPH, 1918, countershaft, large Lucas lamps, horn, etc.; 85 gns.—3, Cluny Mews, Warwick Rd., Earl's Court, S.W. [6054

JUNIOR Triumph, late 1919, lamps, horn, spare belt, condition as new; £70.—King, Cleet Hill Farm, Ravensden, Bedford. [5017

TRIUMPH 3½h.p. and Coachbuilt Sidecar, 3-speed and free, all in good condition; £55.—28, Westfield Rd., Hornsey, N. [5640

1920 Baby Triumph, as new, perfect, only run about 300 miles; nearest £69 accepted.—2, Suffolk Rd. South, Bournemouth West. [5312

TRIUMPH 1919 Combination, fully equipped, good condition, complete; £126; after 6 p.m.—10, Mitcham Rd., Seven Kings. [6336

1920 Model Triumph Combination, perfect condition throughout, appearance as new; £150.—21, Russell Rd., Redland, Bristol. [5871

1920 Triumph, in perfect condition, low mileage, lamps, horn, etc., countershaft model; £120.—Box 7,377, c/o *The Motor Cycle*. [5082

TRIUMPH 1918 Combination, fully equipped, warranted sound; £110; a bargain.—Motor Cycle Marts, Ltd., Fair Row, Chatham. [5986

1915-16 4h.p. Triumph, Tan-Sad, lamps, etc., good condition, sporty machine; £53.—10, Allfarthing Lane, Wandsworth Common, S.W.18. [6289

1913-14 3½h.p. Triumph Combination, Sturmey hub gear, Bosch, Venus sidecar, all on, insured; £80.—Churchill, 7, Egerton Mews, S.W. [2474

BOOK Your Order now for early delivery of any model with the Triumph specialists, The Premier Motor Co., Aston Rd., Birmingham. [5559

TRIUMPH Gloria Combination, brand new, latest 1920 model H, 3-speed, 4h.p.; £190.—Webb, Foundry, Exning, near Newmarket. [5570

TRIUMPH Combination, good condition; any trial; owner given up riding; £85, or near offer.—H. Hicks, Green Farm, Bagshot, Surrey. [5094

Burlington Motor Cycle Co. Ltd

ADAM 'ADAM, BUT WE'VE GOT 'EM.

We challenge anyone to produce a finer reconditioned machine.

Appearance as new.

Re-enamelled and plated in makers' colours. Engine and gear box thoroughly overhauled in our own workshops, and guaranteed by us to be mechanically perfect.

DOUGLAS.

2¾ h.p. **£65**

Trade Supplied.

Machines in stock.

NEW MACHINES AT LIST PRICE

ALECTO, 3½ h.p., 2-stroke, 2-speed, clutch, kick-starter. The machines that broke 21 records at Brooklands.

We are the Sole Agents for these machines, and invite enquiries.

DIAMOND-VILLIERS, 2¾ h.p., 2-stroke, Sturmey-Archer gear box (2-speed), clutch, and kick-starter.

DIAMOND-J.A.P., 2¾ h.p., Sturmey-Archer gear box (2-speed), hand-controlled clutch, kick-starter. The first of the new machines as exhibited at Olympia.

SCOTT, sports model, 2-speed gear, kick-starter

NEARLY NEW.

1920 **COULSON-B.,** 4 h.p., 2-speed, complete with lamps and accessories **£110**

1920 **NEW IMPERIAL-J.A.P.,** 2-speed, clutch, and kick-starter, horn, and pump. Not run 100 miles **£82 10**

1919 **TRIUMPH** and new Speedy Model Sidecar, fully equipped, and ready for the road. A real sporty turnout **£140**

1920 **ARDEN,** 2-stroke, 2-speed gear, T.T. bars, pressed steel forks, in splendid order **£62 10**

1920 **PRIORY,** 2¾ h.p. Arden 2-stroke engine, pressed steel forks, hardly used, complete with headlamp and generator .. **£64**

1917 **B.S.A.,** chain-cum-belt, finished service green **£85**

1917 **B.S.A.,** all-chain, in splendid condition. Tyres as new **£92 10**
(This machine is not a W.D. model.)

Any Machines supplied on "The Motor Cycle" Deposit System.

MOTOR CYCLES FOR SALE.

Triumph.

WAUCHOPE'S, 9, Shoe Lane, London.—4h.p. 1920 Triumph combination, £182/10; solo Triumph, £127/10; also renovated Triumph, £105. [6413

TRIUMPH 1920 Model H with Montgomery Sidecar, 3 lamps, 3 generators, horn, unused; £164.—E.D.G., 80, East Hill, Dartford. [5667

TRIUMPH 3½h.p. 2-speed, F.E., lamps, good tyres, tip-top order, smart; £48, or offer; after 6 p.m. —66, West Side, Clapham Common, S.W. [5745

TRIUMPH, countershaft model, 3-speed, kick start, good tyres and belt; any trial; £75.—2, Kelton Villas, Hawkes Rd., Kingston-on-Thames. [6257

TRIUMPH 3½h.p., clutch model, just overhauled, splendid condition, good lamps, horn, etc.; 45 gns. —Wright, Sidbury, Warlingham, Surrey. [5329

1914 Triumph Coachbuilt Combination, 3-speed, engine 36237, new lamps, body, etc.; £75.—249, Selhurst Rd., South Norwood, S.E.25. [5769

3½h.p. Triumph, 3-speed, free engine, trial, £48; also 4h.p. countershaft Triumph, 3-speed, late model; £90.—Rogerson, Newtown, Wigan. [X9810

SPORTY Triumph, 1914 engine, tank, wheels, mag., carburetter, T.T. bars, almost new, lamps, spares 55 gns. nearest.—Stapleton, Langley, Bucks. [5840

TRIUMPH Combination, 1918, new tyres, perfect, all accessories, Millford sidecar (brand new); 110 gns.; after 6.—282, South Lambeth Rd., S.W.8. [6130

LATE 1919 Triumph Model H., perfect condition, luxuriously equipped, spares; £120, or nearest offer; after 7.—Rudd, 2, Schubert Rd., Putney. [6068

TRIUMPH, 1919, 4h.p., countershaft, P. and H. head light, speedometer, fully equipped, excellent condition; £105.—Green's, Stansted, Essex. [5894

1920 T.T. Triumph, Type D, P. and H. lamp set, Lucas horn, spares, mileage 1,000, as new; £95. —Braithwaite, 32, Winchester Rd., Colchester. [5763

1918 Triumph, bargain, new Henderson sidecar, guaranteed perfect, new lamps, accessories; £135.—Chignell, Woodhouse, Whitchurch Lane, Edgware. [6102

3½h.p. Triumph, in splendid condition, practically new tyres, lamp, generator, and horn; £45, or nearest offer.—C. May, 274, Baker St., Enfield. [5386

F.E. Triumph, 3½h.p., B.B. carburetter, Bosch mag., in good condition, not used last 4 years; first M.O. over £25 secures.—81, Hill St., Peckham. [5018

JULY, 1920, Junior Triumph, 2-speed, Bonniksen trip, P. and H. lighting, Klaxon, Brooks, tools, etc.; £76.—Stephenson, 71, Biccoter Rd., Aylesbury. [5292

TRIUMPH Combination, clutch, coachbuilt sidecar, speedometer, lamps, and accessories, splendid condition; £43.—67, Raleigh Rd., Richmond, Surrey. [6151

COUNTERSHAFT Triumph, latest gear change, fully equipped, lamps, done about 10 miles; £100.—Leighton, 62, Upper Tooting Rd., London. [5525

TRIUMPH 1920 Brand New Combination, lastest Gloria sprung wheel sidecar; makers' price, £182/10.—Churchill Cross Lane, Earlestown Lane. [5664

TRIUMPH 4h.p., countershaft 3-speed gear, kick start, hand clutch, nearly new and at concert pitch; any trial; sacrifice 87 gns.—61, Platt St., Leigh. [5361

1920 Triumph Combination (Gloria), disc wheels, electric light, tools, etc.; bargain, £165.—S. Symondson, Woodside, Southhill, Bromley, Kent. [5678

1920 All-chain Triumph and luxurious bulbous sidecar to match, brand new and unregistered; £185; exchanges.—2, Nightingale Rd., Lower Clapton. [6303

1919 Triumph, countershaft, C.B. sidecar, perfect order, tyres, etc., as new, accessories worth £10; price £115; no offers.—190, Divinity Rd., Oxford. [5382

TRIUMPH Late 1919 Gloria Combination, hood, wind screen, lamps, speedometer, etc., perfect condition; £150.—Write Long, 15, Westbourne Rd., Forest Hill. [5088

TRIUMPH, 3½h.p., 1913, free engine, Bosch, lamps, horn, Osborne gear, renovated, excellent condition; £45.—88, Winchester Rd., St. Margaret's, Richmond [5908

TRIUMPH Gloria Combination, Nov., 1919, little used, Lucas lamps, spares, tube, valve, etc., new condition; £165.—Rev. Stone, Sydenham Villas, Cheltenham. [5371

TRIUMPH 1919 4h.p. Combination, lamps, speedometer, Tan-Sad, in excellent condition; £135, or near offer.—Mattock Motor Co., Mattock Lane, Ealing, W.5. [5891

1920 Triumph Combination, Watsonian Monarch sidecar, Easting screen, electric lighting, all accessories; £165.—14, Shaftesbury Rd., Highgate, N.19. [6122

1919 Triumph Countershaft Combination, luxurious sidecar, fully equipped, heaps of spares, outfit perfect; £125.—60, Wallingford Av., North Kensington. [6037

TRIUMPH Countershaft, 4h.p., new September, 1919, fully equipped, unscratched, and perfect machine; £95.—60, Wallingford Av., North Kensington. [6036

Two-strokes.

QUIETLY and unobtrusively the two-stroke is coming into its own. During the month of August its prominence was unusually marked, for in addition to the team prize in the Six Days Trials this type of engine won the Grand Prix—the cycle car race over the Sarthe circuit.

The Six Days Trials also brought to light the capabilities of the little two-strokes both as regards hill-climbing and endurance, as a glance at the tabulated results will show, while gold medals were awarded to both the solo and sidecar representatives of the two-stroke in the 500 c.c. class. It is no mean performance for a 500 c.c. engine to propel a sidecar and passenger over such a course as was selected by the A.C.U. for the 1920 trial, and that an air-cooled two-stroke of this size should accomplish the feat at its first public appearance is at least a proof that the big two-stroke can be cooled satisfactorily.

Contrary to the often-expressed opinion that anyone can make a two-stroke, this type of engine requires more careful study and design than the average four-stroke engine, especially since there is a regrettable lack of data with regard to many vital points; yet the two-stroke is already one of the commonest types of motor cycle on the road, and its popularity is steadily increasing. Its faults are outweighed by its advantages, chief amongst which may be placed its high power output at low revolutions, its even torque, and the fact that it is an easy manufacturing proposition when once the design has been finally laid down.

It is probable that, when motor cycles are used more for utility and less for pleasure purposes, the proportion of two-strokes will become even larger, and it is not unlikely that the chief disadvantage usually laid to the door of the type—high petrol consumption—will be overcome, or, at least, considerably mitigated, by further research.

The Price of Petrol.

ONCE again the petrol companies have seen fit to make a considerable increase in the price of petrol. Justification for the rise is, of course, forthcoming from the vendors, but, justification or no justification, it is the motorist who is hit, and he is beginning to ask when this state of affairs will cease. The answer is a hard one, and is complicated by the fact that the price of benzole has been raised by a similar amount. It is easy to say that the solution of the whole question lies in the production of a home-produced substitute at a competitive price, but so far such substitutes have failed to materialise in sufficient quantities to be of any practical value. There are immense shale beds in this country capable of supplying enormous quantities of motor spirit, and herein lies a cheering hope, though the necessary plant for the production of a suitable fuel has yet to be installed and developed to a workable state. Benzole can be produced in sufficient quantities and at a reasonable price only by the aid of the Government, and it is to be hoped that, profiting by war experience, the Government will refuse to allow the country's road transport to be controlled by foreign influence.

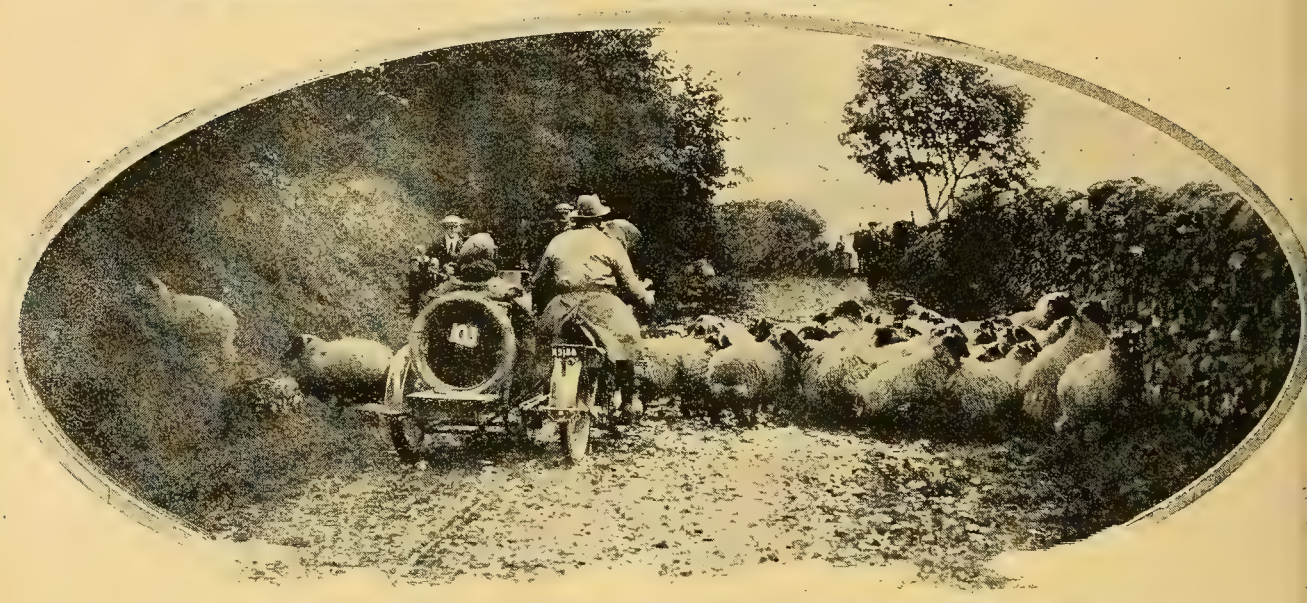
There is little doubt, as *The Autocar* says, that the true gravity of the whole matter will become apparent to the public when the rise in the cost of fuel is reflected in enhanced 'bus fares and increased charges of carriage of goods by road.

In spite, however, of the increased price, the motor cycle is still the cheapest form of long-distance road travel, and a gallon of fuel will go a long way if the machine is carefully tuned and handled, and the popularity of the machine which is cheap to run will be increased rather than otherwise, though it behoves all economical motor cyclists to see that they waste no drop of the precious liquid by flooding carburetters and too large jets.

An Index to the advertisements in this issue will be found on the page facing the back cover.

OCCASIONAL COMMENTS.

BY IXION.



A "Six Days" scene at Beatgate Bank, leading from the Reeth-Muker road to Barnard Castle.

The "Star" Engine.

HERE are two incidents, which go some way to prove that manufacturers use "Star" engines rather than "special" engines in competition work. The manager of one firm decided to enter a lightweight. A month before the trial he met his testers as they came off the road one evening with an unusually large batch of machines. "Which is the best engine in this bunch, boys?" He took it, tuned it up, and put it in the Six Days. Another firm prefers the dynamometer to a road test, and their acceptance standard is that the power curve must not begin to flatten until 2,600 r.p.m. are attained. Most of their engines "flatten" at that figure—they know the reason, but an alternative method of construction which would give a higher "peak" is too expensive for commercial purposes. A few engines show curves which continue to rise after 2,600 r.p.m. They look out for such engines and put them in the Six Days. Just at present they are full of glee because one miraculous engine has topped 3,500 r.p.m. without flattening. That engine is being jealously reserved for the 1921 T.T. On the other hand, a surprising number of firms are quite content to use engines selected at random, for the modern gear box permits even Park Rash to be climbed with lots of power in hand—it is generally steering which constitutes the main difficulty.

Testing Weak Spots.

ONE rider had an experience in the Six Days which alone suffices to prove the worth of the event. He was straddling a thoroughly good 'bus, which developed a small, but puzzling defect, on the first morning. In the scanty time at his disposal he failed to track the cause, and was therefore compelled to overdrive his engine relentlessly in order to keep to schedule time and climb the hills. This overdriving warped his cylinder so seriously that by Tuesday morning the valve guides and seats were permanently untrue, and the valves no longer seated round the full circumference of their heads. The designer concerned will naturally make alterations of an externally invisible character. Meanwhile, the moral for ordinary riders is that if you overdrive an engine which is out of tune, you may run your cylinder.

A Variable Factor.

ONE of the main objections to the inclusion of freak hills in the Trials has never yet been printed. The first and main essential to success is *previous acquaintance with the hill*. On nearly all such hills there is a certain track—it may be on the right, or on the left, or serpentine—which offers an easy climb with steady steering for solos or rational tyre grip for passenger machines. To some extent the A.C.U. outwitted the cute men who had practised over the course, by sending up the sidecars with the lightweights, so that the easy track was often blocked. Anyhow, the man who tackles such hills as a stranger is generally handicapped very severely. When you know the hill, the next thing is to avoid banging open the throttle, which may set the back wheel spinning and is sure to make the steering plungy. Use the minimum of gas, and pick your way delicately, dodging the big stones and the higher reefs of rocks. If you have to look far ahead to pick your path on an unknown precipice, you'll be lucky to get up without footing.

Footing and Foot-slogging.

WHILE the Trials are fresh in all our memories, I should like to direct the attention of trials organisers in general to a common inconsistency. There is a marked difference between using the feet to help a flagging engine and using the feet to steady a plunging bicycle. I had to do the former

casional Comments.—

Summer Lodge and the latter on Harden Bank. ow the A.C.U. observers were inconsistent in this spect. On one hill a member of our staff was seated tween two of these officials (why *two* were posted one hairpin, I cannot say). Mr. A. marked a ilure against every rider whose feet touched ground r any reason. Mr. B. discriminated as far as a man uld between those who footed for steadying pur-ses and those who foot-slogged from want of engine wer. Further, as the reports came in to H.Q., did e judges ever know that Messrs. A. and B. were porting *at the same point*? Or did they suppose at A.'s note "failure" and B.'s note "O.K." ferred to *different* sections of the hill? Finally, the fusal to publish the exact locations of all the served hills made it very difficult for any rider who ay have suffered at the hands of a stupid observer to it in an effective protest. I hasten to add that this as at the worst one of the very few defects of lministration in a brilliantly organised event.

The Plucky Lightweight.

NO stay-at-home student of this journal can conceive the frightfulness of the ordeal to which the lightweight machines were subjected to. mall tyres, small saddles, light fork springs, and, in me cases, 24in. wheels, provide the minimum of sulation against road shocks. The extent to which extra hundredweight or so steadies a machine was vious to any spectator who watched a baby two-roke and a 500 c.c. roadster tackle any rough hill. uite a number of the lightweight jockeys were tyros the game, and had little or no reserve of speed with hich to make up time after a tyre stop. We all ow that the speed of many baby two-strokes up ch easy climbs as Moss Bank is not terrific at the st. Moreover, some of the makers concerned had ared far too high. Even such old birds as the Levis owd put their gears down appreciably at the last inute after one look at Park Rash. The consequence f these factors was that most of the lightweights had very exhausting week, and in some cases the strain as almost past bearing, riders having to employ asseurs every night. I particularly admired cheery axter, whose Radco was overgeared for the job. He kept going, and came up smiling at every control. Luckily, the cooling of his engine was beyond suspicion and its power output at low r.p.m. wonderful, so that he could walk alongside up any hill for which his gear ratio was ridiculously high.

"Seeing a Noise!"

DURING the A.C.U. Trials a few pressmen were given the opportunity of trying Dr. Low's famous "audiometer," which aroused such keen controversy after the silence tests in the 1919 trial. It is a simple and ingenious piece of mechanism. A tiny mirror, ⅛in. square, is so delicately mounted that it vibrates in response to sound waves. The light of a six volt electric bulb is caught by the mirror and reflected on to a ground glass screen. The observer watches this spot of light on the screen. If it merely flickers when a machine passes, the engine gets its O.K.; but if the spot of light tries to jazz off the screen, there is trouble. The apparatus was in rather a sulky mood when we examined it, and no very conclusive opinion of its value could be formed. I rather suspected that it would fail to distinguish ground vibrations from sound waves. Apart from that, it includes no precise means of definitely registering variations in noise—the screen is not plotted in squares by which the jazzing of the light spot can be measured for purposes of comparison. It merely substitutes the eye of the observer for the ear which he would use if he leant against a fence and listened to the machines.

Bump, Brothers, Bump!

WHEN the trial ended, there were many who had corns on a portion of their anatomy where corns seldom form—rowing men only excepted. Early in the week the crew of the passenger machines displayed a certain hesitation about bouncing on their machines in order to get tyre grip. But quite a brief experience of the course banished their nervousness. By Tuesday they were all bumping experts. As soon as an observed hill loomed in sight, the passenger usually swung out on the carrier, and took his time from the driver, the two bumping manfully in unison until saddle pillars wilted and carrier bars creaked. By Thursday there was an unseemly scramble for the best padded chairs at the various hotels.

Start of the last test in the Six Days Trials. Half-an-hour's run at speed on Brooklands track showed that the majority of the engines had retained their power remarkably well.

THE FAMILY SIDECAR

How Economical Holidays may be Spent Independent of Trains

IT is not so many years since the first sidecar appeared on the road. The pioneers who introduced them have but few more grey hairs than when they defied the criticisms of theoretical engineers, and produced the prototypes of what is to-day the most popular vehicle on the road.

Like all inventors and designers, they were confident of the success of their productions; but probably no one realised the great potential popularity of this type of vehicle.

Theory and Practice.

The meticulous engineer in viewing them in learning of their remarkable efficiency, can be likened to the farmer who, on seeing the giraffe at the Zoo, remarked that there was no such animal. Here we have a vehicle which violates many of the laws of mechanics, and yet grows in popularity and utility as the years go by.

The high brows of the mechanical world continue to tell us of a hundred and one reasons why sidecars do not follow sound mechanics. According to them, no sidecar should support much more than its own weight; yet a hundred odd thousand motor cyclists owning sidecar outfits can answer "But it does."

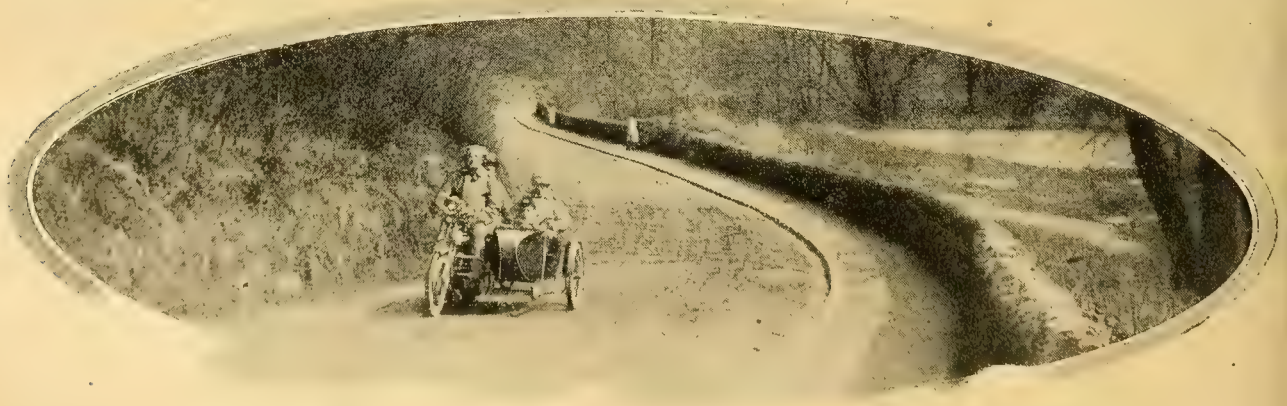
Theory and practice do not always go hand in hand. What does it matter to the thousands who derive pleasure and profit from the sidecar, whether the sidecar is theoretically sound or not. They know that in practice they are entirely practicable, and provide the most economical means of transportation for two or three persons. The sidecar seems to have set up mechanical laws of its own. One cannot gainsay that it is the lightest passenger machine on the road. If it were unmechanical, from the point of view of strength, it would break; it does not. If it were unmechanical from a propelling standpoint, it would require a very large engine and a large amount of petrol to drive it; again, it does not. The writer last year covered over 3,000 miles with a single-cylinder sidecar and family (and an Easting windscreen to add to their comfort) at an average consumption of 83 m.p.g.—and 83 m.p.g. is little less than the average solo rider obtains on 3,000 miles of running.

The Seal of Usage.

Unmechanical or not, the sidecar serves the purpose of over a hundred thousand motor cyclists who, had they the wish, are unable to name a substitute as cheap to buy, and as economical to run.

The one answer to the sidecar critic is "Count them on the road." Any week-end they are abroad in their hundreds, carrying whole families into the country, trips which were unknown to the children who are now men and women.

The accommodation of a sidecar outfit seems to be limited only by the ingenuity of the owner. Fathers of six are not dismayed by the problem. There is no



Independent of trains and free from objectionably crowded railway carriages, the sidecarist enjoys to the fullest extent the open country, and is able to tour outlying districts which, without the sidecar, would be debarred to him.

The Family Sidecar.—

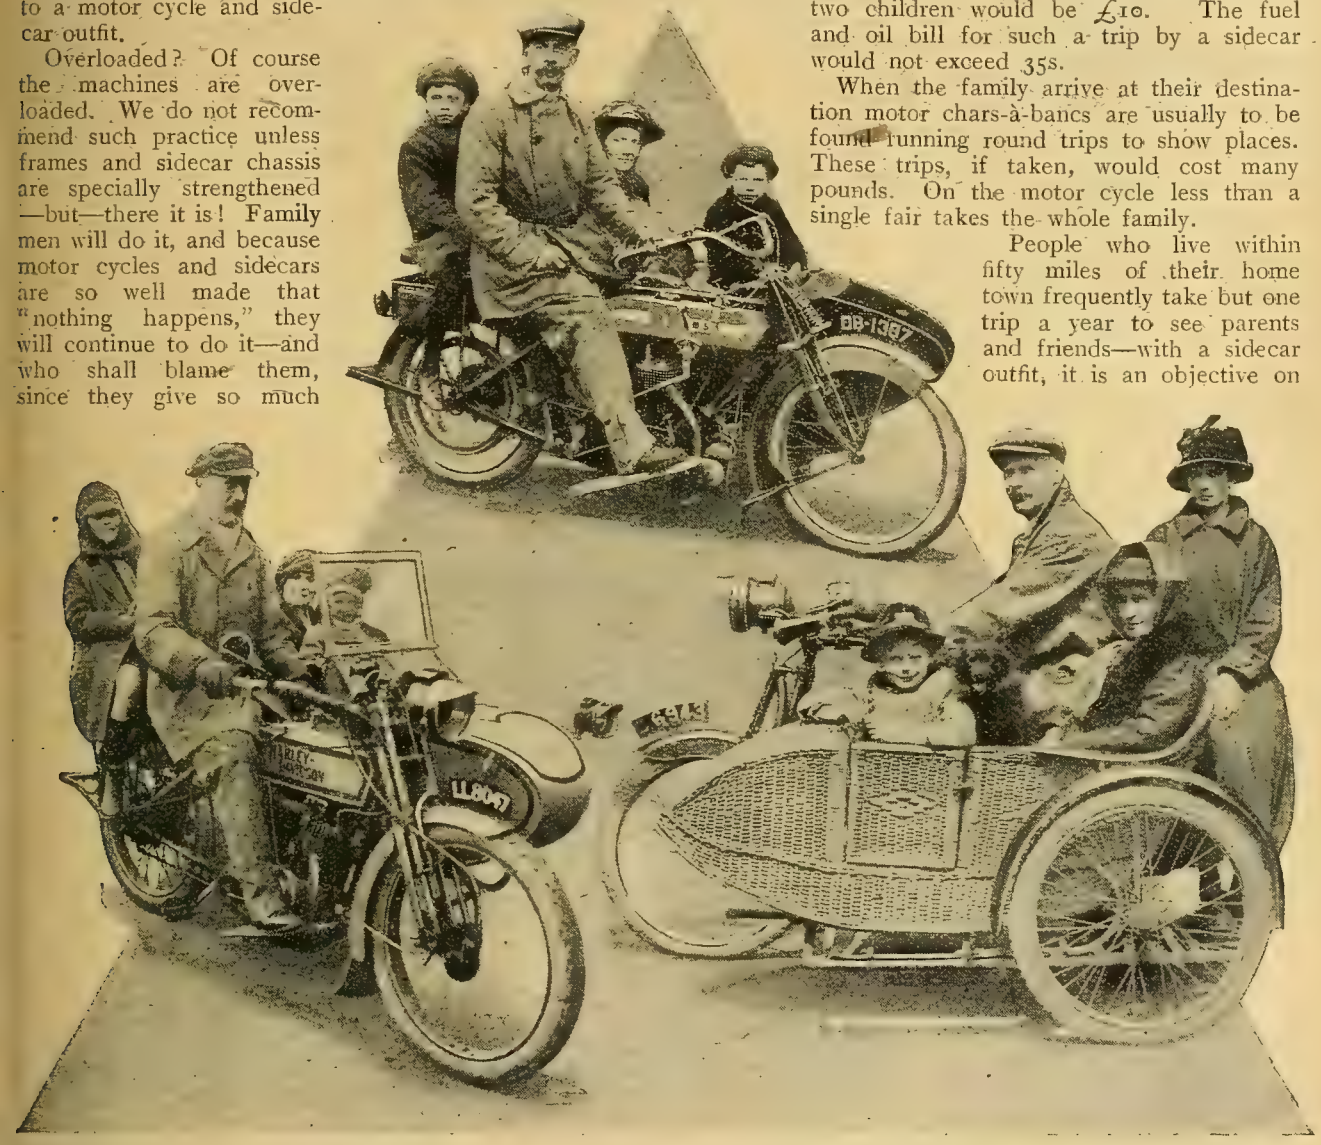
such thing as letting the youngsters "take it in turns" to share the joys of motoring with their parents. Such large families mean a little more ingenuity, and a little bigger engine. Offspring in bunches of two and three are comparatively easy to accommodate without even resorting to a pillion seat to take the eldest. Four youngsters are not an uncommon number, and even larger numbers are occasionally to be seen packed on to a motor cycle and sidecar outfit.

Overloaded? Of course the machines are overloaded. We do not recommend such practice unless frames and sidecar chassis are specially strengthened—but—there it is! Family men will do it, and because motor cycles and sidecars are so well made that "nothing happens," they will continue to do it—and who shall blame them, since they give so much assistance in their school studies as well as enlarging their outlook. Again, there must be hundreds of fathers who could not afford to take a family to the seaside, and give them all such a good time, were it not for the motor cycle and sidecar.

The railway fares for a family of four is a big item these days, especially if the journey be a long one. Take for example a trip of 200 miles each way—the fares alone—at 2d. per mile—for two adults and two children would be £10. The fuel and oil bill for such a trip by a sidecar would not exceed 35s.

When the family arrive at their destination motor chars-à-bancs are usually to be found running round trips to show places. These trips, if taken, would cost many pounds. On the motor cycle less than a single fair takes the whole family.

People who live within fifty miles of their home town frequently take but one trip a year to see parents and friends—with a sidecar outfit, it is an objective on



Why the sidecar is the most popular passenger vehicle on the road! Consider its carrying capacity. Even light cars would have difficulty in accommodating such a number of passengers.

pleasure to so many human beings at so little cost. It is not only the pleasure side of sidecarring that should be considered. There are other points having great influence upon life and happiness. The wife who can forget her household worries at the week-end, and enjoy a few hours in the open-air, is better fitted to face the week that follows. The husband spends his spare time in a hobby which improves his mind, where such close indoor pastimes as billiards and cards might tempt him. The children receive any afternoon or Sunday—or even evening in the summer.

Surely the time has come when the mechanics of the sidecar need not be compared with the ideals of theorists. Sidecars serve their purpose, splendidly and economically. Not only do they do all that for which they were designed, but more—a lot more, and give satisfaction to hundreds who otherwise might be compelled to pay high railway rates and suffer the inconvenience of a set time table and a stuffy railway.

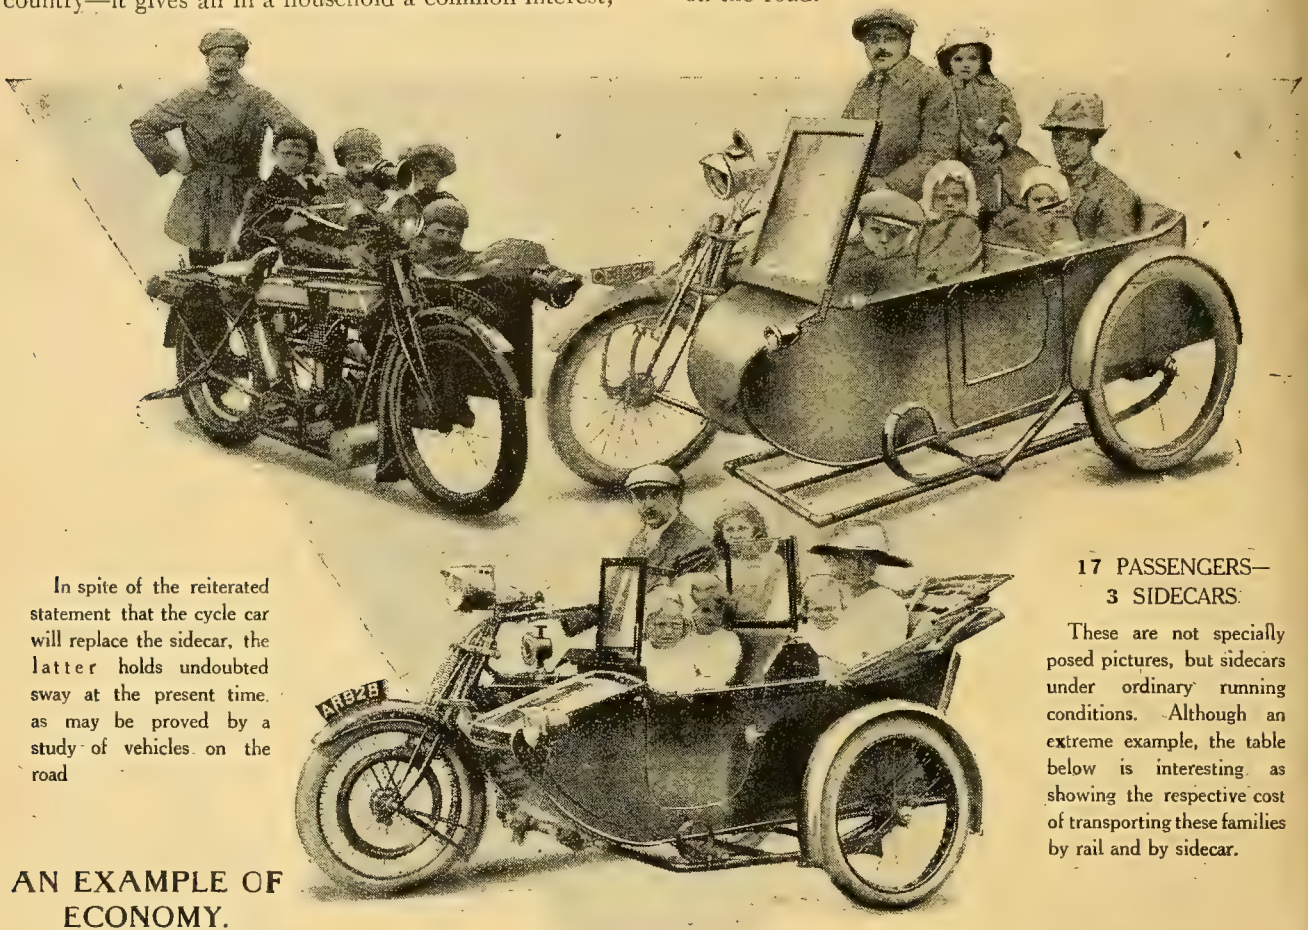
The Family Sidecar.—

carriage when they travelled, which would not be nearly so often.

The sidecar now forms part of family life in this country—it gives all in a household a common interest, and knits ordinary parental affection into companionship.

It will take a great deal to shake the sidecar from its present high position as the most popular vehicle on the road.

VEDETTE.



In spite of the reiterated statement that the cycle car will replace the sidecar, the latter holds undoubted sway at the present time, as may be proved by a study of vehicles on the road

17 PASSENGERS—3 SIDECARS.

These are not specially posed pictures, but sidecars under ordinary running conditions. Although an extreme example, the table below is interesting as showing the respective cost of transporting these families by rail and by sidecar.

AN EXAMPLE OF ECONOMY.

SIDECAR—100 MILES.

Petrol, 4s. 3½d. per gallon, fifty miles to the gallon.
Oil, 100 miles, approximately 1s. 5d.
Cost for the three sidecars .. £1 10 0

TRAIN—100 MILES.

Five adults at 2d. per mile; ten children under twelve years old, 1d. per mile; two children under three years old, free.
Total cost £8 6 8

STANDS PLACED AMIDSHIPS.

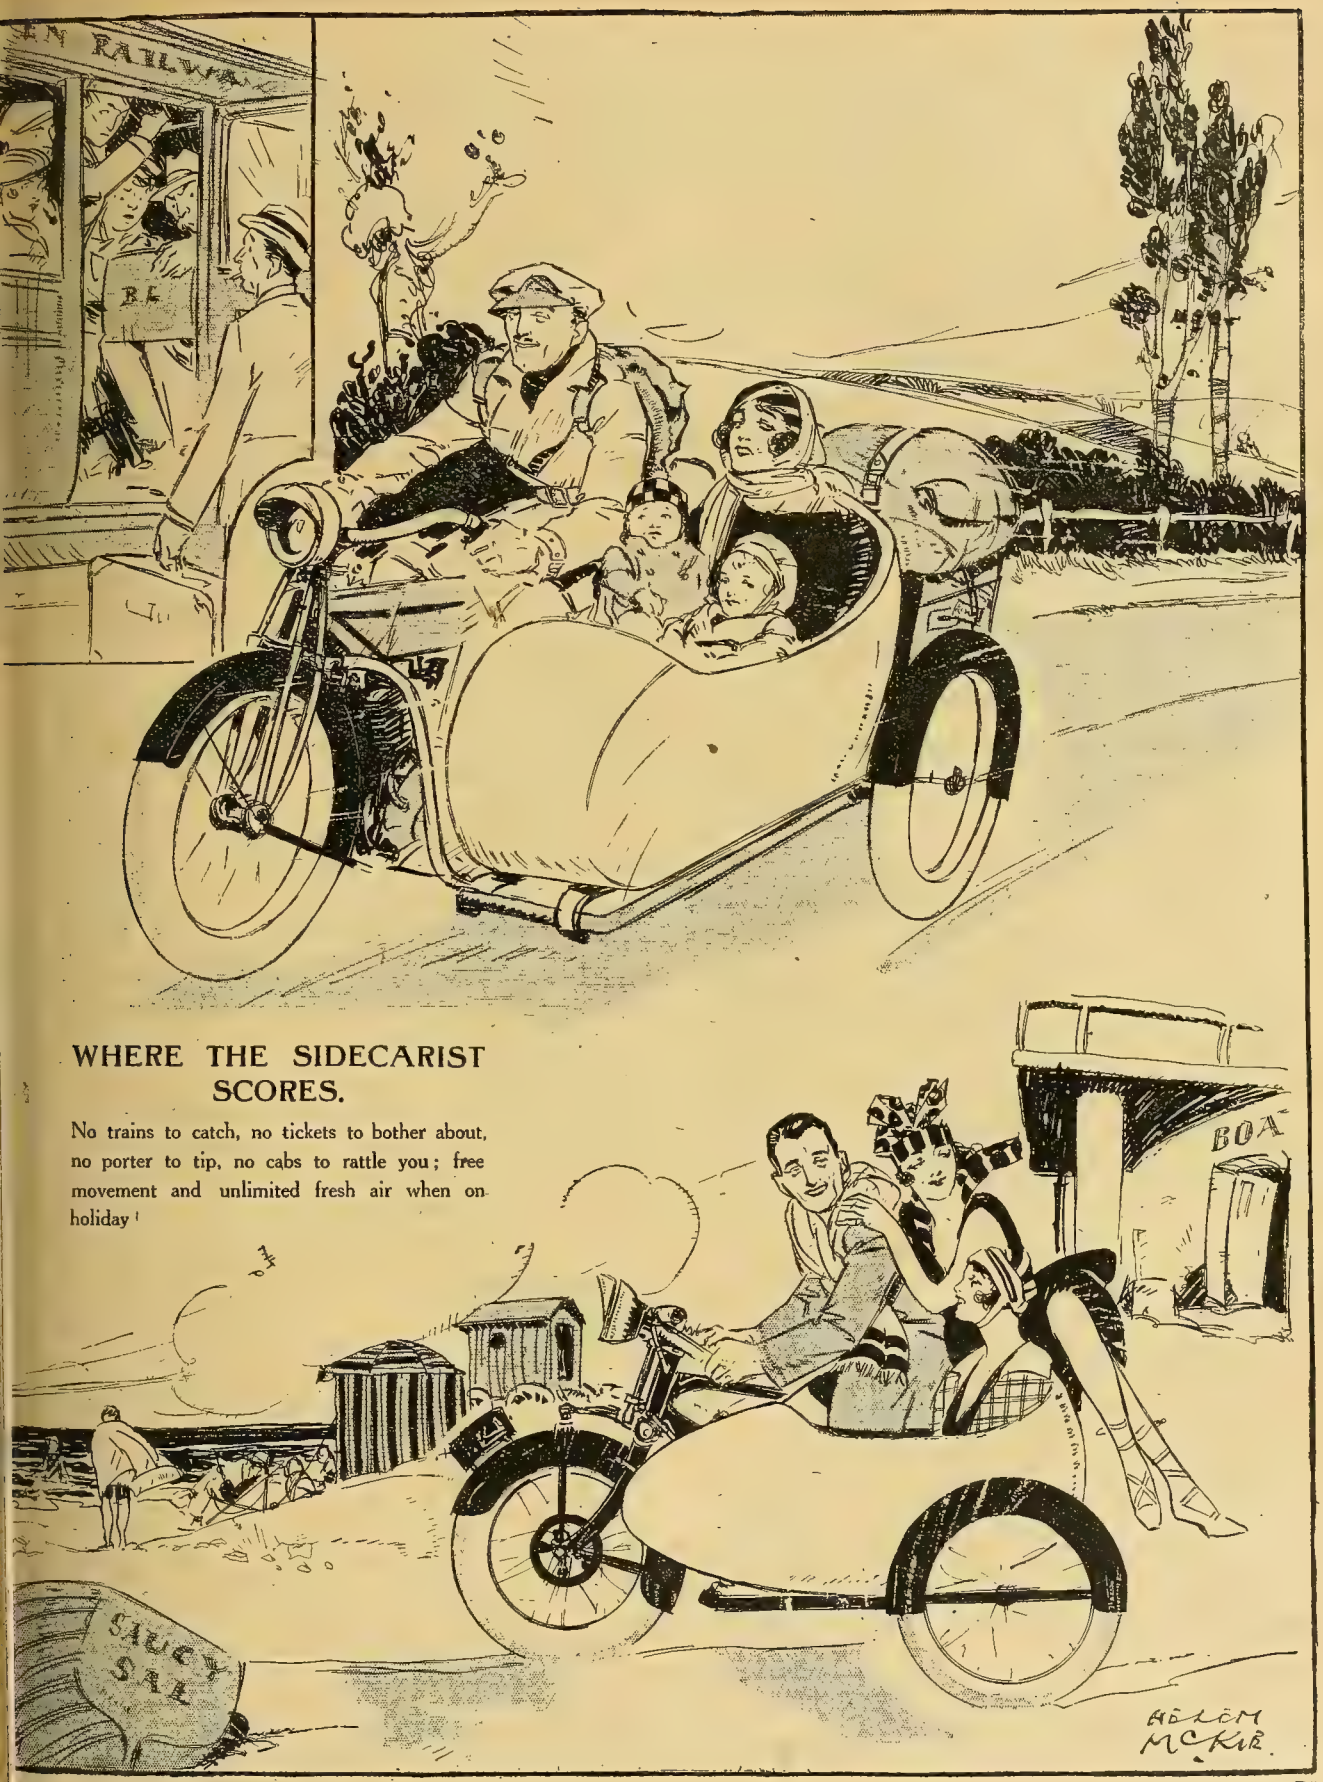
THERE is something to be said for the stand placed beneath the countershaft or somewhere thereabouts—a position which seems likely to become more or less popular, though it is not particularly novel. Such a stand was to be seen on the Midget Bicar, a motor cycle made by Brown, of Reading, having a pressed steel frame and several other points to recommend it. Such a stand makes it very easy to raise the front wheel when it is desired to test the bearings of the head for purposes of adjustment, or to raise the wheel for tyre repairs. The latter can, of course, be done by means of the usual front wheel stand, but the former cannot, as the use of the stand prevents the free swinging of the wheel from side to side.

The central stand should be spring-operated, and it is then very unobtrusive in appearance, no matter whether up or down. Owing to the fact that but little weight is left upon the front wheel, this is somewhat apt to swing round when the machine is placed upon the stand, and some may consider this a slight disadvantage, but it is certainly not a serious one.

On the Fitting of Stands.

While on the subject of stands may I enquire why some stands make it necessary to lift the machine to so great a height. This is a real feat of strength on some powerful 'buses which I could name. If it is only possible to remove the back wheel when it is lifted some six inches clear of the ground, then I think some redesigning of that machine is required. A rear mudguard which can be quickly removed bringing the carrier with it, such as is found upon the Enfield, is a real boon in this respect.

J.H.W.



WHERE THE SIDECARIST SCORES.

No trains to catch, no tickets to bother about, no porter to tip, no cabs to rattle you; free movement and unlimited fresh air when on holiday!

THE A.C.U. AND TRIALS IN THE FUTURE. By B. H. Davies.

CONTROVERSY will doubtless rage for weeks to come about the "freak hill" policy of the A.C.U. and the wisdom of including such hills as Park Rash, Summer Lodge, and Rosedale Abbey in an event which is a commercial advertisement no less than it is a technical test and a sporting ride. I cannot personally excuse the weakness of the stewards in accepting entries for a published course, and then yielding to popular pressure, converting Park Rash into a "bonus" hill, pretending they had "not observed" Summer Lodge, and dodging meekly round the back of Rosedale Abbey at the eleventh hour. The Union ought to have the courage of its opinions. Having announced these hills, it should have stood or fallen by them. If the trade had taken umbrage, private owners would have kept the trials going in 1921, as private owners have always kept the Scottish Six Days going. If the A.C.U. had felt penitent after the event, it could have selected easier going for 1921. But weakness in a governing body is always fatal; and whatever policy may be adopted next year, all sensible motor cyclists surely hope there will be no vacillation about it.

The Demands of Export Trade.

This preamble leaves untouched the fundamental question of whether an ideal trial's route should include hills of the Park Rash calibre or not. On this point, too, I speak for myself alone. We have talked very big since the Armistice about our export trade. If we want export trade, we must design and build machines to suit it, and we must test those machines over roads approximating to overseas conditions. I take it that such runs as Friday afternoon's course, from Huddersfield to Warwick, are useless for the purpose; but that many a colonial rider would feel quite at home in the Scott Trial of September 4th, when a total distance of 100 miles includes not more than a dozen miles of proper road, and the very worst surfaces which the promoters could discover were gleefully included. If this is true, I do no see how an industry which desires export trade ca limit its chief test to hills with hard, smooth surfaces the trials must surely be of an "all in" character?

Two Lines of Development.

But I should append two riders to this conclusion We want to develop machines fit for the Sout African veldt and the Australian bush; we also wan perfect machines for the home user. Home require ments and overseas requirements are not necessaril identical. It is a confusion of thought which subject all machines to identical tests. At the very outset w may admit that the scooter, the motor assisted bicycle and, to a less degree, the sidecar combination and th Morgan, are not intended for the rougher types o oversea service at any rate. These are the very model which are specially handicapped on a hill like Par Rash. No tourist would take them there. Such surfaces bounce a lightweight all over the road, an deny tyre grip to the passenger machine. In a futur Six Days I see no objection to sending the babie and the passenger outfits round the freak hills by switch route.

I go even further than this. It is arguable that th 1920 type of course tends to develop the wrong sor of machine for 90% of our home riders. Let m particularise. I have just been riding a special single cylinder machine developed for reliability trials o the current pattern. It is almost an ideal mount fo jobs of that kind. Indeed, such trials have definitel begotten it, and it invariably emerges from them wit great credit. When any part has broken or give trouble in such events, it has been stiffened up; an if anybody wants a no-trouble ride in such a trial a we have just concluded, he could hardly do bette than enter on the machine I have in mind. But it i entirely destitute of refinement. Comfort is hardl considered in its make-up. Its weight is formidable to a degree. It is a great, heavy, powerful, sturdy,

Impressions of the Six Days Trials.—

bullocky sort of machine, and one that I would not select for pleasure on a summer tour with my wife and family.

Thus the impression is slowly taking shape in my mind that we ought to organise future trials on a dual or "home and colonial" basis. I doubt whether two entirely separate events are practicable. But by dint of switch routes and certain classified awards, the two ideals might be simultaneously fostered in a single event. For example, all lightweights and all passenger machines might be *compelled* (not allowed) to dodge the roughriding sections by means of switch routes. All machines intended primarily for the home market or for the easier spheres of overseas service might be subjected to special tests of refinement, from which the colonial models would be immune. Such tests might include silence, springing, light weight, cleanliness, premiums on low cost, and any other points which a committee of experts considered desirable. Anyhow, whatever solution is finally adopted, it will be a calamity if we cease to develop the "bullocky" type of machine for overseas work: and equally will it be a calamity if we enforce the home user to accept the kind of machine which enjoys Park Rash.

It is necessary in this connection to reconsider Park Rash and Summer Lodge from the special standpoint of solo mounts of 500 c.c. and over. Given a clear course, devoid of baulking, and a dry day, any decent rider so mounted can climb such hills. But such machines ought *not* to be sent up these hills compulsorily. The inevitable result is to produce solo machines for home use which are:

(1) Too heavy,
(2) Undergeared,
(3) Overpowered.

Only sporting riders want to tackle such going. Sporting riders do not compose more than 5% of our community. The remainder will be well suited with a far lighter, less powerful, and more refined machine. If the dual trial which I have outlined were ever organised, and I were a manufacturer catering for both the home and the colonial trade, I should hope to enter a 150 lb. 3¼ h.p. machine in the "home" class and send it round the switch routes: and to enter a 300 lb. 4 h.p. mount in the "colonial" class, and send it up all the precipitous river torrents.

In two respects the results of the trial are deceptive. The route was so intensive that continuous bad weather would have produced disaster, and very few golds could have been won if the going had been uniformly wet. The kind aloofness of Jupiter Pluvius saved the A.C.U. from red revolution. On the other hand, low be it spoken, sheer bad driving prevents many men from doing even better. Too many riders charged the bad hills at speed on open throttle. I select two entrants as models in this respect. Mrs. Knowles did no better than some of the crack men, but her sex gives her pride of place. She took the rougher hills just fast enough to get steering way: not so fast that her Norton plunged out of control: not so fast that she could not deliberately pick out the best going: not so fast that her back tyre began to spin. Of the passenger entries Hall on the Morgan was superb. No one had a harder task, for his central driving wheel could seldom use the hard track at the side open to solo and sidecar machines alike; moreover, he had overturned on the eve of the trial, and drove in considerable pain at times. He handled his throttle like a master, and suffered less from tyre spin than any other three-wheeled driver.

The brake test was almost a farce. Whatever imperfections our brakes have, inability to hold a

A SIX DAYS TRIAL SCENE.

A string of competitors on Carlton Hill. The leading riders are G. Kuhn (Levis) and E. E. Palmer (A.B.C. sc.)

Impressions of the Six Days Trials.—

machine which starts down a precipice at a crawl is not one of them. I doubt whether we shall get a satisfactory test of brakes or of comfort until we employ official testers like the Air Ministry test pilots: and that means limiting the entries plus a lot of back-chat from disgruntled entrants about "personal opinions." Still, when every practised rider is well aware that a few makes stand head and shoulders above the ruck in respect of steering excellence and riding comfort, it seems a pity that they receive no credit whatsoever for these vital qualities in the supreme technical test of the year.

The inclusion of so many water-splashes has justified itself, if only from the "colonial" standpoint. Water-splashes are unduly hard on belts, which still have a limited future on the lighter solo machines. But this year they have brought into relief defects in ignition and carburation which are certainly unpardonable on overseas models, and are undesirable on home models, seeing that many owners besides leaving their machines out of doors in heavy rain during business dismounts, are often very careless of their machines in other respects.

Deserting the area of controversy, the net effect of the Trials is to prove that the modern British motor cycle need fear no comparisons. It has emerged with distinct triumph from a most searching ordeal; and on level financial conditions is fit to compete with any rival in any country.

A COMPETITOR'S IMPRESSIONS. By H. Mortimer Batten.

UNDOUBTEDLY one's opinion as to the severity of a reliability trial is governed to a large extent by the machine one rides and the degree of luck one experiences. Given the right machine and a no-trouble run one's impressions of the severest event afford nothing but peaceful retrospect, while the reverse applies with equal vigour; but all this granted, practically everyone who competed in this year's Six Days was of the opinion that it was unprecedented in its seductive properties. Friday was, I suppose, the alleged easy day, but Friday morning left everyone in a state more or less bordering on hysterical collapse. Having scaled Harden Bank and ricochetted over miles of broken moorland track, interspersed by a liberal sprinkling of Yorkshire cobbles and the surprise right-angle bends for which these small manufacturing towns are unequalled, we at length struck good road a few miles from Huddersfield, when a casual glance at the watch surprised almost everyone into the realisation that nothing but a colossal blind could save the situation at the lunch control. For the last few miles into Huddersfield practically everyone was riding at full throttle; fortunately the police were there to receive us in good spirit—probably labouring under the prevalent impression that it was a race.

Nervous Anticipations.

Monday was a sporting day, the first feature of note being the steep descent into Pateley Bridge—a fine opportunity for the rush to burn out their brakes at the outset. At the top of this hill I gravitated to a standstill in order to await a team mate, and discovered too late that my right legging was hitched up in the kick starter! There was nothing for it but calmly to lie down in the centre of the road with the machine on top, and wait for some good Samaritan to come by and relieve the situation, which simple procedure was carried out to the letter.

An excellent lunch at Ilkley was not appreciated as it might have been, for everyone was in a state of quivering excitement owing to the sinister proximity of Park Rash. We absently munched lettuce with our jelly, or helped ourselves to mustard with the apple pie, for Park Rash has only one point in its favour—its shortness! Never was it in worse condition than as we were destined to find it—the Morgans and sidecars having chewed up the only "rideable" track—and though this climb might be considered a fair hill in a one-day trial, the ascent is so much a matter of luck that its inclusion in an important six days event would not have been just to the competitors. After all, the object of the trial is to prove the machines, not merely to weed out all but the trick cyclists, who might be better employed in a circus.

A little later in the day one rider shot into a side road and performed a marvellous stunt climb of an unknown freak hill. Reaching the summit he was injured by the absence of observers and fair spectators to witness his performance, then discovered that he was on the wrong road! Later still, nearing Darlington, the representative of a well-known tyre ran into a black and tan pig, and knocked a rasher of bacon off it!

An Impossible Test.

One endeavours to accept the choice of Trials' organisers with all the charity and good sportsmanship available, knowing the difficulties of their lot, but the inclusion of Crackpot Gill or Lodge Hill (on Tuesday it was called a variety of names) was in every way absurd. The most serviceable machine ever built for ordinary use might prove utterly incapable of such a climb, and beyond completely exhausting the majority of the competitors at the very outset of the day, and fostering a spirit of revolt already at boiling point, one fails to see that the inclusion of this freak served any useful purpose whatever.

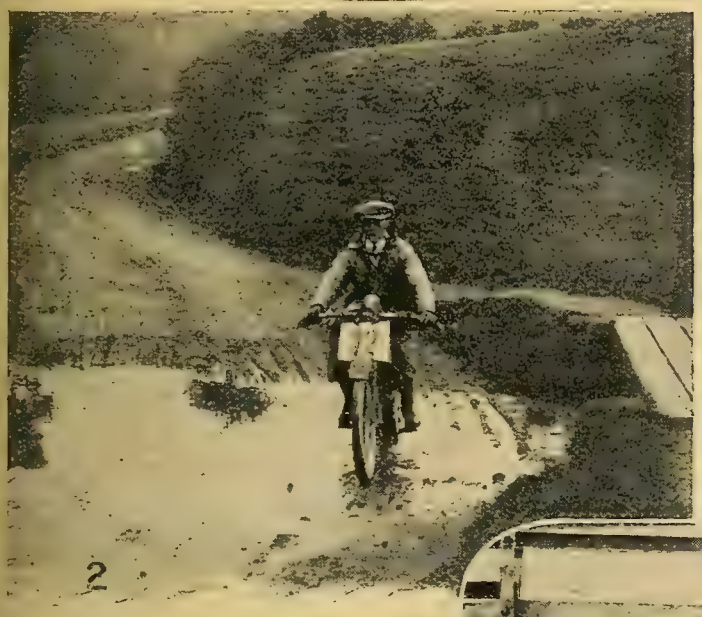
Crackpot Gill is an ascent too rough and severe for the use of carts. Sledges are used on it. It is a climb only fit for an antelope in its prime. True that Alexander, Clark, and one or two others got up it somehow, but personally I was among the ninety-nine who pushed, skidded, and sprawled from the foot to the summit. At the top of the hill riders were to be seen in every stage of exhaustion, some with their knees aspiring heavenwards while they voiced their views to the infinite, while one of the three-wheelers, owing to the absence of help or the intellectual inability of those who *were* present to lend a hand, took one and a half hours to gain the summit.

Naturally this hill was washed out, as also were Park Rash and Dent Hill, though the last-named was certainly more reasonable than was Park Rash; but the question on the lips of everyone was: "Why include hills which merely involve a diversion from the rules, besides annoying everyone?"

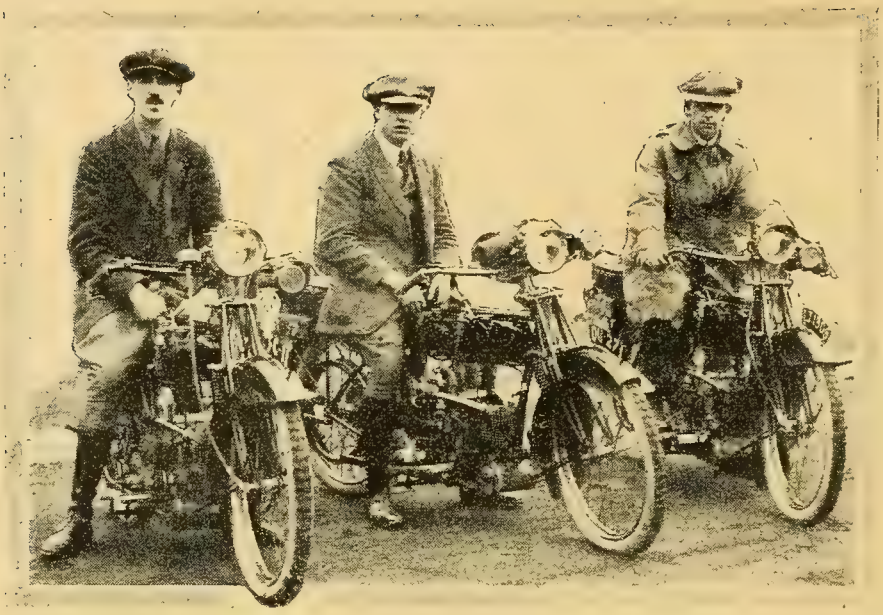
With the exception of Park Rash and Crackpot, there was really very little in the trial at which a sporting rider could complain. On the whole the

WATERSPLASHES IN THE SIX DAYS TRIALS.

The watersplashes on the whole gave but little trouble, the belt-driven machines naturally suffering most, especially in cases where a gradient followed the splash.



(1) How S. Wright (Humber) avoided wetting his feet at Hutton-le-Hole. (2) J. W. Wills (Verus-Blackburne). This splash at Gunnergate did not alarm any competitor. (3) G. M. Townsend (P. and M.) approaching Boltby Bank, on the Hambleton Hills, near Thirsk. (4) A solo rider and a sidecarist negotiating the splash at Hutton-le-Hole.



FLAT TWINS THAT PROVED THEIR WORTH IN THE SIX DAYS.
Three Humber riders: H. O. Evans, L. Crisp, and E. Redvers Johnson, all gold medal winners.

route was very ingeniously laid out, as one was apt to be caught napping on any portion of it, and an unreliable machine was bound to go under. The route marking was excellent, but one was constantly misled into the impression of having any amount of time in hand, only to experience a rude awakening a little further on.

How the Machines Performed.

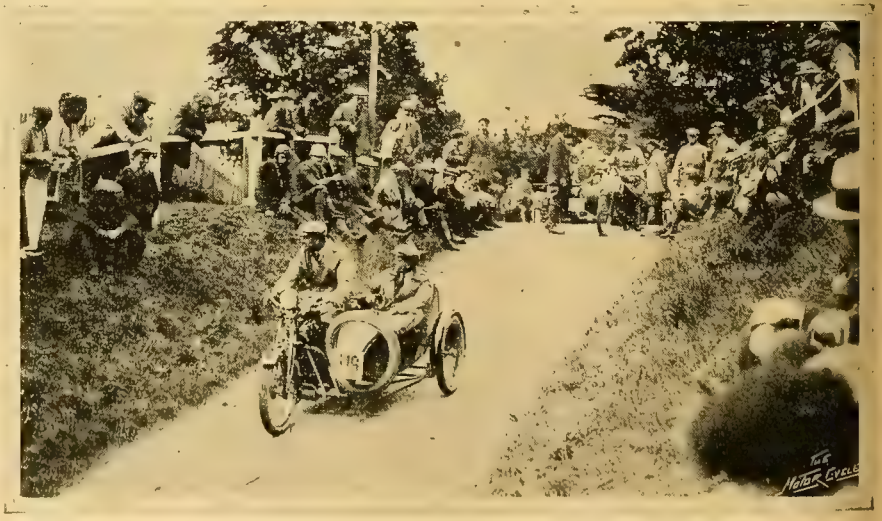
As regards the machines, one of the most striking impressions was the vigour of the single-cylinder mounts, though the Scotts made very light work of the trial, and appeared to land their riders home each evening with a minimum of fatigue. Alan Hill spoke of his machine as ideal for the work. One of my riding companions was Dudley Barton on a 4½ h.p. Dunelt, two-stroke. His machine appeared quite capable of the gruelling, and did not overheat, though it seemed rather hard to start. The Sunbeams, Triumphs, and Ariels were all fast and powerful, while as usual the B.S.A. team ran like clocks. The P. and M.'s experienced very unusual carburetter troubles early in the week, and had not improved their engines by the time that the trouble was located; the A.B.C.'s ran very sweetly and were decidedly fast, but again the luck of this little sidecar outfit was out.

All things considered, however, the Velocettes were perhaps the surprise of the trial so far as competitors' comments showed. These little two-strokes seemed to have vim enough for all comers, and watching them lap at Brooklands one could not but admire their lively tune. Indeed, practically all the two-strokes were surprisingly lively and capable, and certainly they did more than hold their own against the four-strokes of the same c.c.

Tuesday was the star turn of the trial, and leaving Crackpot and its friends of a feather we ran across one observed hill after another, while in places the road was strewn with derelict sidecars. Wednesday was a holiday compared with it, the weak omission of Rosedale resulting in a morning of deadly main road monotony, broken only by occasional water-splashes. One of these was of exceptional depth, and Archie Cox, riding a Beardmore-Precision, lay down in the middle of it. As one of the dailies observed: "He appeared to be very angry." I think that the organisers were right in observing certain splashes, as, though this caused some indignation among the belt drive merchants, it goes without saying that a transmission system that will not stand wet should not be allowed to live. (Cheers from the Colonials!)

At Brooklands a good many competitors wore themselves out by anxious waiting, for incidentally there was more waiting than anything else. Would valves and transmissions stand this crowning test? Judging from the number of derelicts seen ultimately on the track, a good many did *not*, but on the whole the machines did exceedingly well.

One cannot help but feel that the organisation at Brooklands was not up to Scottish standard. Dr. Low did his best, like the sportsman that he is, but Dr Low could not do everything and get his Audiometer going at the same time. The track test had to wait till Dr. Low had finished the brake test, and I fail to see



G. E. Stobart satisfying the judges that the brakes of his 7 h.p. James sidecar were in perfect order at the end of the Six Days testing.

Impressions of the Six Days Trials.—

that it required a very scientific mind to judge the braking results. This test, by the way, would have been more to the point had we been compelled to descend the 1 in 4 portion with brakes "off," then bring our machines to a standstill at the bottom of the hill. It requires very little braking effort to retain a speed of 4 m.p.h., which most of us did, but it is quite a different matter to have to check the inertia of a rapidly moving machine on a steep gradient. I imagine that everyone complied with the conditions, excepting one sportsman, who had no brakes at all, and who called a cheery "good-bye" as he shot past the judges.

Then, when Dr. Low had finished on the track, we had to wait for Dr. Low for the final examination. When Dr. Low ate and slept no man can say. We waited for endless hours. We sat on our machines, we lay down on the concrete, we squatted on hard bits of fencing, we speculated and indignated, and finally it was well after lighting-up time ere the writer, together with a bunch of others, all intent on catching the 10.30 from King's Cross, were free to go. We charged off at terrific speed, lost ourselves in the grounds, and found ourselves ultimately riding round a cleared patch in the forest, where the timber had recently been felled. Ploughing our way through ferns, moths, dead leaves, and branches, we eventually found another road, and finally proceeded in massed formation for London. This, I think, was the most thrilling part of the whole trial. Riding head light to tail light, we careered into the city of cities, thirty in a bunch. Once or twice non-competitors became accidentally involved in the crowd, and were observed modestly to retire. The London police were taken completely by storm. Some luckless copper on point duty was suddenly overwhelmed by a whole bunch of motor cyclists, riding in circles round him, and all inquiring frenziedly for different stations.

Anyway, we caught the 10.30, and aboard it swore a solemn if breathless oath never again to indulge in the mad folly of competition riding. We always take this oath. It means exactly nothing, beyond the realisation that a memorable event is at an end, and that one year hence we shall again set out on another light-hearted adventure of the same kind.

DEFECTS IN BABY TWO-STROKES.

An Appeal to Manufacturers to Eliminate Present Weaknesses.

THERE is no type of motor cycle whose virtues one appreciates more fully than the baby two-stroke. That it has shortcomings we all admit, but such shortcomings, far from being inherent to the breed, are chiefly within the power of manufacturers to eliminate. The foremost of them are noise, high fuel consumption, irregular firing, flimsy fittings, saddles, and finish.

The noise problem is the foremost defect in all present designs—I know of no noteworthy exceptions. Those of us who are somewhat elongated in the limb always feel absurd when perched on the top of a lightweight, and, what is more, we look it. There are few things more laughter-provoking than, on hearing a noise almost equivalent to the starting up of a big rotary, to turn and observe a little two-stroke dribbling up the quiet village street at 15 m.p.h., with a huge rider perched on the top of it.

Recently I have been riding a 7-9 h.p. twin and a baby two-stroke alternatively. On the 7-9 h.p. twin one glides quietly through the traffic with never a hitch. On the tiny two-stroke, however, the milkman's horse stands straight on end immediately I appear.

I have possessed two-strokes which, as rural riders' knockabouts, could not be beaten for general utility, but I have become disgusted of late as regards the noise question. If manufacturers wish to net in that huge army of riders who, like myself, are sensitive to ridicule, they must first hit upon some better system of silencing than they have employed hitherto.

Fuel Consumption.

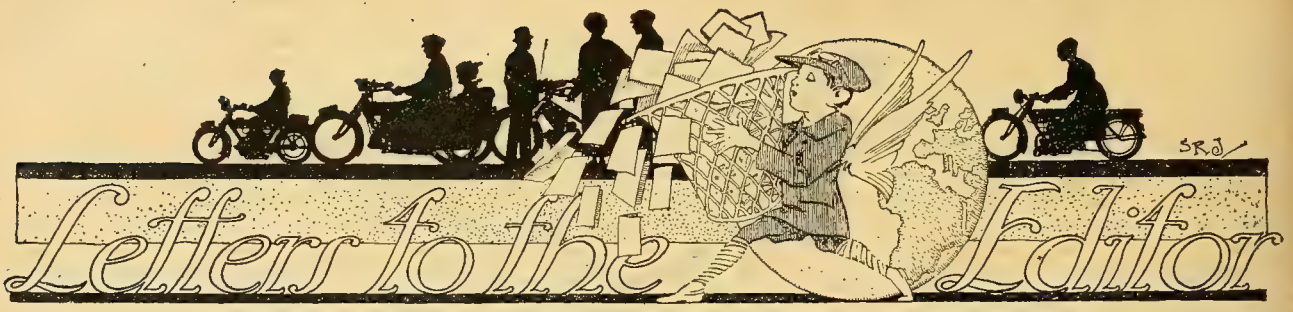
This is another absurd point regarding most two-strokes. Not only are they more noisy than the largest and heaviest of motor cycles, but usually they are more costly in fuel. In fact, they compare unfavourably with a big twin outfit. I have found that with the heavy twin I could make a long journey on less petrol than it was possible to make in riding solo on the lightweight—and in considerably shorter time!

This also is a matter that manufacturers must remedy even if at a slight loss of power, for no one who rides a two-stroke is out for speed impressions. If he were he would not ride a two-stroke. What he wants is steady pulling, reliability, and economy—above all the latter, since the baby is essentially an economy mount. That the weakness can be overcome is shown by the performances of a small number of two-strokes on the market, which, while answering all the purposes of the normal two-stroke rider, regularly accomplished 160 m.p.g., and on straight runs 180 m.p.g.

Irregular Firing.

This is difficult to overcome, and will probably continue to exist till radical alteration in the design takes place. The chief cause of it is that the volumetric efficiency of the crank case and that of the cylinder do not always coincide to suit the fluctuations of the mixture. With the throttle half closed, the crank case may draw in too small a charge to explode at the pressure attained when it gains the cylinder and the spark occurs—the mixture not being correct for the pressure to which it is subjected. This is such a knotty point that I can only say that until it is overcome manufacturers must make allowances in their transmission systems for periodical irregularities in torque. This done, and the engine properly silenced, the four-stroking trouble would not be so great a grievance.

So much for a candid opinion of the chief weaknesses of the popular two-stroke. That it is popular and deserves to be is a fact one need not emphasise, but my contention is that it might be infinitely more so were some of the weaknesses common to the class, though not applying to all, overcome. CHINOOK.



The Editor does not hold himself responsible for the opinions of his correspondents.

All letters must be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

2 M.P.G.—A CHALLENGE.

Sir,—As petrol consumption challenges appear to be in the air, I should like to ask if anyone can outdo me on one pint or gallon of petrol on any make of machine of the same power. My machine is an A.J.S. 2¾ h.p., about 1914, and after draining the tank I measured in one pint of petrol, and on this I ran twenty-four miles. This I can do again. S. COOK.

A BENZOLE-PARAFFIN MIXTURE.

Sir,—For some time lately I have been running my 1920 4 h.p. Triumph on a mixture of three parts benzole to one part paraffin. The experiment has been a wonderful success. I get more power, slower running, better acceleration, and about the same, or slightly better, m.p.g. It runs equally well on a mixture of half and half. A friend of mine has run his 4 h.p. 1914 Triumph on it also, as has another friend on his 2¾ M.A.G.-O.K. Both of them endorse my above remarks. C. C. KING.

COURTESY ON THE ROAD.

Sir,—A few days ago I was riding my motor cycle on the Horsham Road with a little girl on the Tan-sad. Unfortunately we had a very bad speed wobble, and eventually came to earth. My passenger lay unconscious for many minutes. Miss Ruby M. Ayres, who was being driven to Brighton in her car, on seeing what had occurred, had the car stopped, and at once helped my passenger to the cushions. She had the car driven very slowly to a doctor, and had the wounds dressed immediately, with the result that my little friend is A1 again.

I feel very grateful to this lady, as without her help it might have been serious. M. BURCHATT.

MYSTERIOUS NOISES.

Sir,—I heard a mysterious noise on my 8 h.p. Sports Zenith the other day.

It took the form of a sort of twang as if something was hitting a spoke of the front wheel. It only happened when the machine was in top gear, and then only occasionally. The explanation is simple, yet curious. I have just fitted a Cox "Atmos" carburetter, and this projects rather further than the original, and the petrol pipe came out rather farther than before.

The noise was formed by the belt fastener touching the pipe when the belt vibrated slightly above its normal level.

Shrewsbury. A.W.7723.

Sir,—Noises and their elimination are always interesting. I have spent weeks in finding some on the various machines I have owned and ridden since 1910. The last I traced only this week, after nearly twelve months of mystery. Perhaps "Puzzle" may find his noise comes from a similar source. In my case, the rear mudguard appeared to be the offending portion. I bound this up and wedged it everywhere without result. I packed and unpacked the tool cases dozens of times. I wired the stand firmly to the mudguard, and bound everything movable near the rear of the machine with insulating tape, but still the annoying rattle at low speeds over any roads would be heard. Being on holiday and having nothing better to do, one morning recently I took off the back stand completely to see if the bolts could possibly be a slack fit, though I had tightened them and felt them dozens of times. As I laid the stand aside I heard my old friend the "mysterious rattle" on the bench. On giving the stand a shake I had the feeling that I had got hold of a baby's rattle, or else the braziers had left a few tools inside the tubes of the stand. On closer investigation, and after drilling a ⅜in. hole in one foot of the stand, I was able to extract piece after piece of brazing solder. About ten pieces in all came out, some over 2in. in length. How they got there, or if brazing is usually accompanied by such internal deposits I do not know, but I have since been able to enjoy my riding without that unsatisfactory feeling of listening to a mysterious noise and being quite unable to locate it.

Paignton. A.S. (CJ 2340).

THE SIX DAYS TRIALS.

Sir,—I am sure that I am not alone when I say how disgusted I feel that the A.C.U. should have allowed themselves to be intimidated to the extent of the elimination of one of the tit-bits in the way of hills in the trials.

To anyone who has been following the account of the trials as reported in a certain daily paper, it did not come as a surprise.

True to its ordinary policy—dark hints were dropped early on, as to the impracticability of some of the climbs—rumours of protest meetings amongst the competitors, etc., etc. Thus public opinion was worked up—and doubtless all those who failed to climb these hills remarked something about its "an ill wind," etc. As a spectator at Park Rash on Monday, I say that the hill was by no means unclimbable, and most of the failures were simply due to bad driving.

Bolton. DISGUSTED.

MOTOR CYCLE LIGHTING.

Sir,—I have been interested in the lighting problem of motor cycles for some years, and I notice that every time the subject is mentioned, what to my mind is the nearest solution to the problem is overlooked.

I find there is nothing more simple than the Low acetylene generator for a great number of very short runs on one charge of carbide; it is true that the working pressure varies considerably—but once the stored up gas is used, and the water valve starts working, the pressure remains constant. This requires a little tap turning, but would be hardly noticeable on a short run.

I found two disadvantages in this generator (which I notice they apparently have not rectified on their latest model). Vibration causes the tin of the carbide to wear a groove in the container which would get worse; this can be cured by fitting a tin washer round the inside of the container. The top of the generator after a time gets out of shape owing to the pressure of the three wing nuts which clamp it on, and the internal pressure. A specially cut rubber washer, to allow for the top not being quite flat with the top of the container, will cure this, and the top once having set, this should not occur again.

My ideal lighting outfit would undoubtedly include a Low generator and a Fallolite head lamp. I understand, however, that a new Fallolite generator is being made, a model of which I was shown, and it appears to be the neatest yet on the market, and most simple. The original generator sold with this lamp would not hold enough carbide (the Fallolite burner consumes seven litres only per hour).

I fail to see anything more simple and ready at a moment's notice than the above—can anyone suggest one better?

I might mention that I have no interest in either of the firms concerned. H. E. CLEEVE.

ISLE OF WIGHT STEAMERS.

Sir,—I have just had a trip through the Isle of Wight, all around making up 108 miles. The roads are very good except at Brading to Sandown, very bad, also from Shalfleet to West Cowes. I had difficulty in getting petrol at Seaview, but able to get plenty everywhere we called throughout the island. I came back through Yarmouth to Lymington by boat to the New Forest, making up my run to 136 miles all told. On the Southampton Company boats, from Portsmouth Clarence Pier, you are not asked to empty your petrol tanks; the same at Lymington. But if you travel by Portsmouth Harbour Rail Company boats you must empty your tanks. It costs 4s. 4d. for rider and motor cycle from Clarence Pier to Ryde, all pier tolls included. From Yarmouth to Lymington 5s. 6d. all told, therefore my fares and running costs, less food and lodgings, on 2¾ Douglas for 136 miles tour, cost me 19s. only. I don't think anyone wants a better three days' tour than this.

E. MARTIN, Junr.

SPRING CARRIERS.

Sir,—We are interested in your article under the above heading in the issue of *The Motor Cycle* for August 26th.

It is of little good using a pillion seat which is merely a cushion or a board on springs: it is asking for trouble, as experienced by "Wharfedale." A spring set that vibrates in any direction and gives unchecked vibration is sure to give unsatisfactory results.

A pillion seat such as the Tynesider has a set of rebound springs, which comes into action immediately unnecessary vibration occurs in the principal springing. Also four pistons prevent swaying; this adds to the even working of the whole spring set.

It is surprising the indifference shown in the selection of a pillion seat, whereas the matter is of some importance The safety of the passenger, or the goods carried, depends on the scientific principles on which the spring set is constructed. A good many purchasers are satisfied with a mere spring seat or cushion. It is imperative that the springs should not sway, as this causes the passenger to throw the steering out of balance, which is often the cause of accidents.

T. E. HENDERSON.

ECONOMY.

Sir,—I feel sure many of your readers are unable to appreciate the advantages to be obtained from many of the good things advertised. My present 3½ h.p. machine until recently consumed one gallon of petrol per 100 miles. I determined to improve on this by the following means, and herewith give results:

I first fitted a "Blank" carburetter, guaranteed to use 20% less petrol than any other. The result was 100 miles per .8 gallon.

I then fitted the "Blank" inlet valve stem lubricator and air leak preventer, guaranteed to give an extra 25 m.p.g. Result, 100 miles per .64 gallon.

I next used "Dots" for mixing with my petrol, giving 25% per gas. Result, 100 miles per .51 gallon

Afterwards I fitted the "Blank" economy valve to inlet pipe, and mixed "Boildag" with my lubricating oil. Result 100 miles per .45 gallon.

On changing over from petrol to benzole I got a still further improvement—100 miles to .4 gallon.

By fitting a streamline tank, disc wheels, aeroplane footboards, and mudguards this was further reduced to 100 miles per .35 gallon.

By fitting a Brooks saddle and wearing Beacon oilskins I got it down to 100 miles per ¼ gallon.

I also understand that by using the "Blank" three-speed gear I can save a further .25 gallons per 100 miles, after which by fitting "Blank's" petrol magneto and plug I expect to reach the producing stage, and hope to produce about one quarter of a gallon per 100 miles, from the sale of which I should be able to cover cost of tyres and lubricating oil, thereby practically cutting out all working costs. Also, with the prospect of prices continuing to soar at their present rate, the factor for depreciation may also be eliminated—in fact, I am anticipating, if I am able to put in sufficient mileage, making a small, but steady, income out of it.

King's Lynn. MOONSHINE.

SANS MAGNETO.

Sir,—On reading the very interesting letters in your paper regarding engines sometimes running sans magneto, I am a little inclined to disagree with the one in your issue of August 19th by Mr. J. Milner.

In my opinion, his theory of spontaneous combustion on the Diesel principle, being the cause of an engine sometimes running on for a short period, when its usual ignition system is disconnected, cannot very well be sound. As he pointed out, the Diesel system is an established fact, certainly, but only when the conditions are suitable, and the engine is designed for it.

As it is only when an engine is very hot that the point in question has been known to take place, one would take the theory of incandescent carbon or plug points, as being more likely the cause.

Considering that even if the engine were only running slowly, the induction stroke is performed in a fraction of a second, it is unlikely that incandescent points could be cooled down by an already hot gas in such a short period.

I have seen quite low compression car engines run for a short period (when run out of water) with their magnetos switched off.

I can assure your correspondent that some of the engines were by no means new, nor had they anything like the compression that would be needed to bring the Diesel system into action.

Again, when an engine is overheated, the mixture is much more rare, owing to the sudden expansion on entering the hot cylinder, thus again making his theory still less likely to be correct.

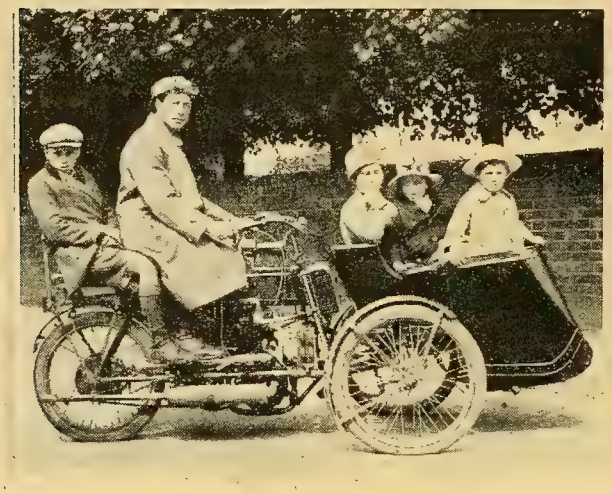
Like Mr. Milner, I am quite open to be corrected, and I shall be only too pleased to read other views on the subject.

Urmston, Manchester F. C. RIDINGS.

Among the Rover riders were some of the youngest and most enthusiastic competitors in the Six Days Trials. Out of nine Rovers entered five gained gold medals. Here are seven of the riders, reading left to right: W. J. Montgomery, D. A. Atkin (gold), W. Brandish, jun. (gold), W. Danskin (gold), G. Featherstonhaugh (gold), G. L. White (gold), and E. S. Astley.

A SIXTEEN-YEAR-OLD TRICAR.

Sir,—Knowing your readiness to publish anything of interest to your readers, perhaps the accompanying photograph comes within that scope.



Sixteen years old and still going strong. (See letter, J. W. Fosker.)

The picture represents a tricar made in 1905 and still going strong. It was made by the Wolf Co., is propelled by a 4½ h.p. A.J.S. water-cooled engine, fitted with their gear box and clutch, and is chain-driven. Carrying the load shown it can average 15 m.p.h. The rear tyre, which is an Avon, was fitted in 1912, and has had one retread. We ran 200 miles recently, climbing a hill 1 in 22 one mile long with load shown in the photograph. J. W. FOSKER.

TOURIST TROPHY RACES, 1920.

Sir,—There appears to be a fairly general impression that accessories and other items used by competitors in the 1920 T.T. were all of a special nature, and not as sold to the public.

We would advise you, therefore, that our Summer Huile de Luxe, as supplied to and used by successful competitors in these events, was identical in every way with that supplied to the trade and to the public throughout the United Kingdom and abroad.

Summer Huile de Luxe was used by the first, second, and third in the 250 c.c. Class; by the second, third, and fourth in the Junior Race; and by the second and fourth in the Senior Race.

We venture to make the suggestion that in future races, everything used, including accessories, should be standard, or such as is or can be supplied to the "man in the street." It should be possible for officials of the Auto Cycle Union to purchase, on behalf of competitors, all the equipment necessary, which we think would result in events considerably more interesting than as at present.

In view of the tendency towards the development of the touring side of motor cycling, the Tourist Trophy Races should in the future be considered more as a test of touring motor cycles and tourist accessories than of almost purely racing equipment.

J. W. G. BROOKER,
For Price's Co., Ltd.

SHOULD TWO-STROKES BE HANDICAPPED?

Sir,—In a letter replying to "A.L., Glasgow," Messrs. Veloce, Ltd., mentioned that "two-stroke capacity is really much less than the stated capacity," owing to the exhaust port cutting out a percentage of the effective stroke by its early opening.

This is frequently mentioned as handicapping the two-stroke, when comparing it with four-stroke engines, and I have looked many times to see this popular error corrected, for, as a matter of fact, the whole of the piston displacement of the two-stroke is useful for induction, just as in the four-stroke, but *via* the compression chamber or crank case, the time element being the same in both engines, and shortened or lengthened equally in either case by the amount of lag permitted. This lag will, of course, have the effect of limiting the charge volume to something less than the amount of piston displacement in *both* types of engine.

On the power stroke *both* engines lose approximately the same proportion of the stroke. In the one case by the port being uncovered by the piston, and in the other by the port being uncovered by the valve.

Contrary to popular opinion, therefore, the two-stroke engine does not suffer from ineffective piston travel any more than the four-stroke does. There are, however, other obstacles to efficiency, and difficulties to be overcome which do not exist in the four-stroke, and one cannot but appreciate the manner these have been tackled, and largely eliminated by some two-stroke makers.

As an instance, I was picnicking on Bwlch-y-Groes some days ago when three little Velocettes came humming up the hill (which was in very bad condition), and without a pause or falter went clean over the top. This was repeated three times by the trio, and the last ascent was faster than the first. It was quite inspiring. When I get too old for my "big 'bus" I must seriously consider getting a Velocette.

JAS. L. NORTON.

AN ADAPTATION FROM AERO PRACTICE.

Sir,—As one of the large number of motor cyclists who have been connected with the R.A.F. during the last few years, I was very interested in the description in *The Motor Cycle* of July 29th of an attempt by Mr. A. W. Doyle to embody the principle of the Gnôme "Monosoupape" aero engine in a motor cycle power unit.

All those who have had any experience with this type of engine will agree, I think, that the necessity of enclosing the exhaust, if used for road work, is one of the least of the difficulties met with in any such daring attempt to utilise the "one-valve" principle.

As will be obvious to anyone who thinks of the cycle of operations in the "Monosoupape" engine, there can be no question of even reasonable flexibility, as there is no induction effect proper on the carburetter employed, and all that has been possible in the past in this direction has been a very complicated variable timing.

Again, the "Monosoupape" has been very liable to catch fire in the crank case, and, as far as I can see, any attempt to achieve comparative flexibility by a system of variable timing will only increase the chances of a fire taking place. The very principle employed entails having the ports in the cylinder walls uncovered during part of the firing stroke, and the excessively long exhaust period was the only safeguard against the rich mixture in the crank case catching fire.

Before Mr. Doyle's engine would be of any use at all in a motor cycle he would have to devise some entirely new method of controlling the speed of this type of engine, and preventing a fire in the crank case at every change of running conditions.

REVS.

Beckenham.

BOOKS AND MAPS FOR MOTOR CYCLISTS

Issued in conjunction with *The Motor Cycle*.

	Price net.	By post
"MOTOR CYCLES AND HOW TO MANAGE THEM." The standard handbook on the motor cycle. Covers every subject relating to all types of motor cycles, their management and care. Twenty-first Edition. Just published	2/6	2/10
"HINTS AND TIPS FOR MOTOR CYCLISTS." Containing over 400 useful "wrinkles" and helpful hints in regard to motor cycles. Seventh Edition.	2/-	2/2
"TRACING MOTOR CYCLE TROUBLES." A reliable system for tracing motor cycle faults and of remedying any trouble when found. Fourth Edition.	2/-	2/2
"THE MOTOR CYCLE" ROAD MAPS England and Wales, Scotland, London (showing roads into and out of London and avoiding London). Mounted on linen. Set of three, complete in case.	5/6	5/10
"THE MOTOR CYCLE" ROUTE BOOK. With 32 pages of Road Maps of England and Wales, Scotland, and the London District. New Edition. Just published	5/-	5/4

Obtainable by post (remittance with order) from ILIFFE & SONS Ltd., 20, Tudor Street, London, E.C.4, or of leading Booksellers and Railway Bookstalls.

QUESTIONS AND REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not **must be accompanied by a 2d. stamped addressed envelope for reply.** Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Garage Owner's Responsibility.

If a motor cycle and sidecar is taken to a garage, and stolen during the owner's absence, is the garage proprietor liable for damages, assuming, of course, that the garage of the machine is to be paid for?—R.J.

The garage proprietor is not liable for the loss of his customer's motor cycle and sidecar through its being stolen while in his charge, unless it can be shown that the garage proprietor was himself guilty of negligence, such as leaving the premises improperly secured.

A Question of Date.

About eight weeks ago I purchased a machine which was advertised as a 1917 machine, but a few weeks later I advertised it again quoting the same date. Now the man who bought it from me finds that the machine was made in 1916. Of course, I had no idea that it was a 1916 machine, otherwise I should have specified the proper date. May I ask you if you consider me responsible for the error, or is the person from whom I bought it?—N.D.

As you apparently advertised the machine in good faith as a 1917 model, there is very little possibility of the buyer succeeding in any proceedings against you. Before advertising a definite date, however, you should take steps to ensure that it is correct.

Converting Motor to Dynamo.

I have a 6-8 volt electric motor. (1.) Could I convert this into a dynamo for lighting my Triumph combination? (2.) Would it be cheaper to buy a dynamo? (3.) Is there any necessity to run the current *via* an accumulator to the bulbs? (4.) Could it run straight from the dynamo, there being dry batteries to switch on to when stationary? I intend driving dynamo off inside of belt rim.—H.V.M.

(1.) No doubt it would be possible to convert the motor into a dynamo, but we cannot offer any opinion as to its suitability for motor cycle lighting. (2.) In all probability it would be both cheaper and more satisfactory to obtain a dynamo specially designed for this purpose. (3 and 4.) Unless provision is made for regulation of output in such a way that it does not rise unduly when the speed of the motor increases, it is necessary to use an accumulator in circuit; even then its fluctuations in output would seriously affect the bulbs.

Low Maximum Speed.

(1.) When I am on the road with my 1¾ h.p. machine the throttle is fully open. I only travel at about 10 m.p.h., and yet as soon as I lift the exhaust lever (so that I just take the weight of the valve) I get twice the speed. How is it that the machine runs so slowly? (2.) How is it that I can only run with half air? (3.) When I come to mount a hill, no matter how slight, the engine stops. I have had new bushes and new piston rings, and I could not get better compression if I tried. The inlet valve is automatic, and a single-lever carburetter with an air tap at the front is fitted.—G.W.

(1.) In all probability the exhaust valve stem or the tappet is badly worn, and requires renewing; also, an improvement might be effected by fitting a stronger exhaust valve spring. Air leaks in the induction pipe should also be eliminated. (2.) A larger jet in the carburetter would no doubt allow you to open the air control more. (3.) It is likely that the exhaust valve closes too early, and this will happen if the wear mentioned in answer No. 1 has taken place.

Magneto for Opposed Two-stroke.

I have a two-stroke flat twin engine. As both cylinders fire together: (1.) Could I use the magneto of a single four-stroke by running it at engine speed and splitting the high-tension lead? (2.) If not, is there any other method of utilising this magneto?—W.J.H.

(1.) A single-cylinder magneto will not fire two plugs simultaneously. (2.) If you obtain a double pole plug, and fit this in one cylinder, and fit an ordinary pattern plug in the other cylinder, you will be able to utilise the magneto, but this method is not altogether satisfactory, and has been abandoned in favour of a special two-spark magneto.

A BROOKLANDS SCENE.

The last control in the Six Days Trial. Two of the N.U.T.'s entering the Paddock. The riders are F. J. Fieldhouse and R. C. Winn.

Adjustment of Automatic Carburetter.

[?] I have a new 4 h.p. 1920 Blackburne motor cycle, Amac single lever, 29 jet, air set to No. 3. On low speeds, either gear, the engine misses badly, but anything over 15 m.p.h. is perfect. Any opening or closing of the throttle, at any speed, causes a pause of two or three seconds, when the engine fires again and runs perfectly until another opening or closing becomes necessary. What is the correct combination of jet and air intake for this machine? I find if I set the air to No. 0 or 6 it makes practically no difference to the running of the engine. Two experts have tried to put the machine right, but without success. The plug, magneto, and carburetter are clean, and appear correctly adjusted.—R.J.P.

From the symptoms you describe we should imagine that you are getting too rich a mixture, since opening of the extra air holes should make a considerable difference. Probably a 26 jet would improve matters, but it is possible that this might be too small. We would recommend you to try numbers 26, 27, and 28 jet, and if you are unable to obtain satisfactory results, it would be wise to write to the makers, who will put you right in the matter of choke tubes.

READERS' REPLIES.

Defective Drip Feed.

I note in your issue of the 19th ult., that one of your readers is having trouble with the Best and Lloyd oil pump, fitted to his B.S.A., the oil being blown back into the sight feed glass by crank compression, owing to the non-functioning of the pen steel disc. A similar trouble occurred with mine upon reassembling after cleaning. Investigation proved that I had mislaid the Thackray spring washer, thus causing pen steel disc to lodge in the clearance caused by omission of this washer, between the non-return valve housing and screwed boss of sight feed. This can be remedied by the insertion of an ordinary piece of bell wire (one thickness) bent to the internal dimension of the valve housing in which it is placed before putting back the pen steel disc seating. An examination of the sectional drawing of this type of oil pump, which is included in the literature issued by the makers, will make the action clear.—C.G.C.

Another Mysterious Noise.

Re "O.W.'s" trouble with the Ariel. If he takes his engine down and removes the ball races from the crank case, washes them well in petrol and then holds them up to the light, he will probably find one or two of the balls skinned. I had the same noise in my B.S.A., and also a friend's P. and M., and found that was the trouble. If it should be so, and he cannot obtain a new race, new balls can be fitted quite easily by knocking out the small rivets which hold the side plates in place. Ball race can be removed quite easily by laying the crank case over a gas ring, inner side towards gas; the race will fall out when the case gets fairly hot.—J.M.S.

Bad Pick-up.

With reference to your correspondent, "R.J.P.'s" letter in the issue of *The Motor Cycle* for August 26th, I had a single lever "Amac" carburetter fitted to a 1920 "Martinsyde" combination, and have also noticed that if you "open out" too much the engine is inclined to pause for an instant, then pull splendidly. I have found that with this type of carburetter it is only necessary to open out very gradually, when the machine answers the throttle admirably. M.M.G.

RECOMMENDED ROUTE.

EDINBURGH TO KENDAL.—J.D.G.

Edinburgh, Penicuik, Leadburn, Romano Bridge, Broughton, Moffat, Beattock, Lockerbie, Kirkpatrick, Carlisle, Penrith, Shap, Kendal.

BLACKBURN TO LLANDUDNO.—W.F.R.

Blackburn, Hoghton, Heapey, Chorley, Wigan, Ince, Hindley, Abram, Warrington, Daresbury, Frodsham, Dunham, Chester, Queensferry, Flint, Mostyn, Prestatyn, Rhyl, Abergele, Colwyn Bay, Llandudno.

LICHFIELD TO NEWPORT.—C.H.T.

Lichfield, Sutton Coldfield, Birmingham, Selly Oak, Longbridge, Bromsgrove, Droitwich, Worcester, Malvern Link, Great Malvern, Malvern Wells, Ledbury, Ross, Walford, Monmouth, Raglan, Usk, Caerleon, Newport.

THE A.C.U. SIX DAYS TRIAL.

All the going was not on moorland tracks; on rare occasions competitors were favoured with stretches of good tar macadam roadway F. J. Price (Diamond) and R. B. Clark (Coulson) near Stockton

SPARKLETS

Going to America.

As a fitting gift at parting, the directors and staff of Messrs. Tuck and Blakemore, Ltd., of Coventry, presented a Coventry made gold watch to Mr. Heetor P. Tuck, who is taking up an important position in the tool and machinery business in the U.S.A.

Unibus Address in London.

Those who are interested in the Unibus, which was described in *The Motor Cycle* of August 19th, should note that the Service Motor Company, Limited, who are the sole concessionnaires, have moved into new premises at Service House, 94, Great Portland Street, London, W.1.

The Automobile Industry and the University of Bristol.

Messrs. W. H. Dorman and Company, Ltd., of Stafford, have presented to the Automobile Engineering Department of the Merhant Venturers' Technical College in the University of Bristol, a standard 10 h.p. petrol engine, complete with all details, to be used in investigations on the use of fuels and trials on various types of carburetters, etc.

A Machine of Moderate Price.

Quantity production is the secret of low price, provided that it is allied with simplicity of design. A perusal of the leaflet we have recently received from Messrs. Humphries and Dawes, Ltd., Hall Green Works, Birmingham, which describes the forty-eight guinea model 2¾ h.p. O.K. Junior, shows that the above qualities have been kept constantly in view.

A Specialist in Tanks.

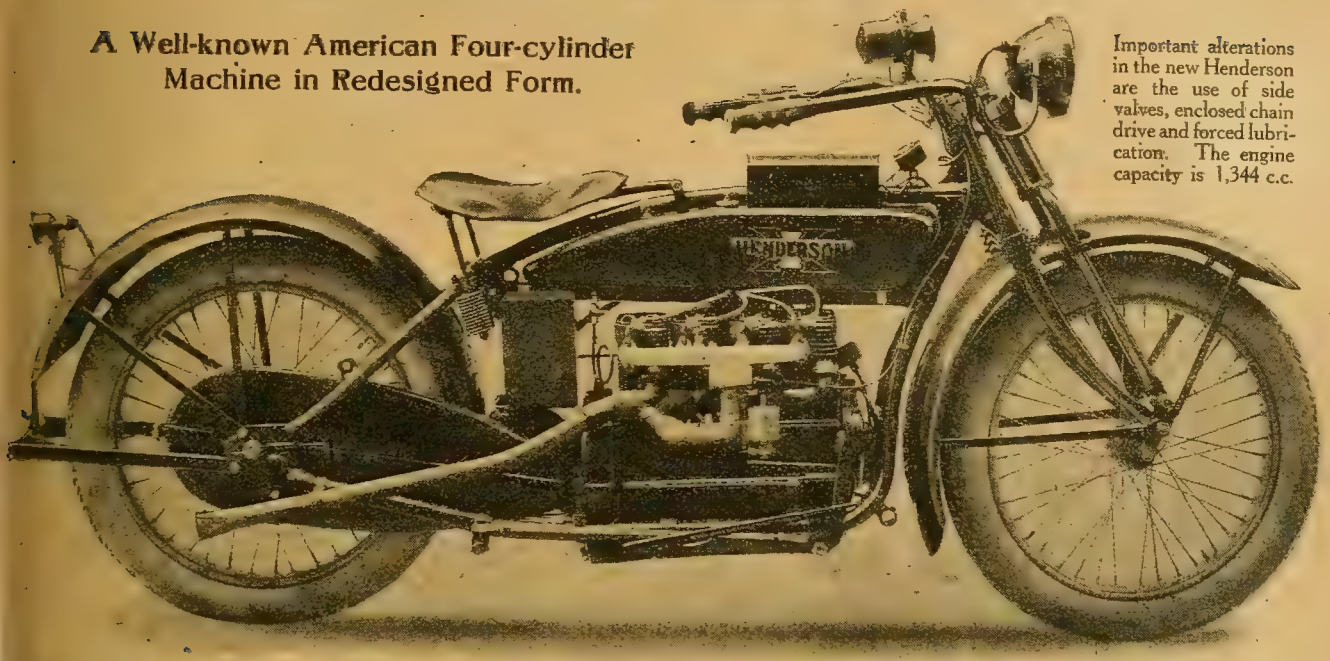
Riders who intend to do their own overhauling during the coming winter months should consider the advisability of entrusting their motor cycle tanks to an expert for any necessary repairs and re-enamelling, as an amateurish finish is most obviously betrayed on this part. In the case of an old model it might be worth while to consider the fitting of an entirely new tank with up-to-date equipment. Both classes of work are catered for by Mr. A. Green, of Water Street, Salford, Manchester, who issues a useful little booklet illustrating a variety of motor cycle tanks.

Amateur Rider Joins Trade.

To all who have followed Midland competitions during the past two seasons, the name of Mr. H. Boynton is familiar, and many "private owner" awards have fallen to his lot, thanks to his successful handling of the 5-6 h.p. James outfit, which he has invariably ridden. Having now accepted the position of sales and advertisement manager for the Tan-Sad specialities (F. H. Headley, Freeman Street, Birmingham), we may hope to see this rider continuing his competition successes in his new connection

THE MODEL K HENDERSON.

A Well-known American Four-cylinder Machine in Redesigned Form.



Important alterations in the new Henderson are the use of side valves, enclosed chain drive and forced lubrication. The engine capacity is 1,344 c.c.

THE Henderson was the first four-cylinder American motor bicycle to make its appearance on the English market, and is now handled by Messrs. Melchior, Armstrong, and Dessau, Ltd, of 14, Great Marlborough Street, London, W.1. It is considerably different from the previous model, which was referred to in *The Motor Cycle* of July 17th, 1919, for it has been entirely redesigned.

The engine is now fitted with side by side valves, while considerable alterations have been made in the inlet and exhaust manifolds, which are now one above the other. An American-made Zenith carburetter (the first of its kind to be seen on a motor bicycle) has been fitted. A hot air muff surrounds the exhaust manifold, and the air pipe to the carburetter is provided with a movable sleeve so that cold air may be drawn in instead of hot in very warm weather. There is also a butterfly valve for restricting the air supply in order to secure an easy start.

Car-type Lubrication.

The whole lubrication system has been completely altered, and a car system of forced lubrication has been introduced, namely, the oil, instead of being carried in a separate tank, is now stored in the sump at the bottom of the crank chamber, and the oil is delivered through a drilled crankshaft to the principal bearings. The big-ends are lubricated by dipping into troughs formed in the tray, which acts as a lid to the sump.

On the reverse side of the engine is the Berling magneto, which is gear-driven, while above it is installed the Splitdorf dynamo for the lighting installation. This is driven by a belt from a pulley running on the magneto-shaft.

The oil pump is carried on the forward end of the timing gear, from which it is driven.

Enclosed Final Drive.

So far as clutch and transmission are concerned, these closely follow the design of previous models, namely, a multiple-disc clutch, while the drive from the crankshaft to the gearshaft is by bevel. One important item in the transmission is the adoption of a chain case, so that the final chain drive is now completely enclosed.

When we first made mention of the new Henderson, it was stated that a reverse would be supplied for sidecar work, but this is not the case with the model at present being delivered in this country.

The bore and stroke are 69 mm. × 90 mm., giving a total cubic capacity of 1,344 c.c., while the pistons used are 3in. long. All-wearing parts, such as crankshaft, gudgeon pin, and bearings, are of ample size. The crankshaft bearings are 1¼in. in diameter, and three of these support the crankshaft.

The Model K frame is of the duplex variety. Among its notable features is the triangular construction at the bottom of the down tube. The tubular cross member at the bottom of the inverted Y completes the triangle, and serves as a sidecar lug. The rear ends of the forks are closed, and the wheel is withdrawn by means of a knock-out spindle. The spring forks are of the enclosed plunger type; but, beyond their great strength, call for no special comment.

Since the Henderson is made by the manufacturers of the American X, it is not surprising to have to record that the type of brakes employed upon the last-named machine are also to be found on the Henderson. The brake most commonly used is that on the offside of the machine controlled by means of a pedal; this is of the band variety, while the internal expanding brake is controlled by a pedal on the near side, and is provided with a lock which may be instantly engaged or released.

Oil Circulation Gauge.

The weight of the latest model Henderson is 420 lb.

Among the refinements to be found on this machine are the ammeter, which shows whether the dynamo is charging or not, and the oil gauge forward of the crank case shows whether or not the oil is circulating.

SPEED TRIALS IN ULSTER.

THE third of the series of speed trials at Magilligan Strand, under the auspices of the Ulster Centre of the Motor Cycle Union, was marked by a number of accidents, one of which may prove serious. Owing to a dense fog, which came on during the progress of the races, two of the riders collided at the turn. W. J. Sheils had his leg broken in four places, and T. Stewart sustained a broken wrist. In another of the races H. Chambers got into some loose sand while riding with one hand on the handle-bar, and fell heavily.

The chief event of the meeting was a race between Ferguson on a 30-98 h.p. Vauxhall car, and a selected number of motor cyclists. The race was run over a distance of five miles with one turn. The Vauxhall car won easily, covering the distance in 4m. 16s., and beating J. W. Shaw (3½ h.p. Norton) by 35s. S. M. Adams (2¾ h.p. Verus) won the scratch race for lightweights, and the scratch race for 600 c.c. machines was won by J. W. Shaw. Owing to the incoming tide, the 100 miles handicap was reduced to one of twenty-five miles, and was won by H. McGimpsey (3½ h.p. B.S.A.).

NOTES ON THE SIX DAYS TRIAL.

Oddments Gathered during the Four Days on the Yorkshire Moors and during the Brooklands Tests.

The Humber team ran very consistently, and S. Wright's performance with a sidecar machine was one of the best amongst the passenger machines.

Most of the Cleveland hills are scarred by deep stone gulleys, laid at an angle across the road to carry off storm water. In ascents they are trying enough, as one dare not shut down too far up a freak hill, and the risk of smashing a crank case is always present. But a deep and unexpected gulley in a descent is an abomination: the front wheel dives into it and chocks.

The L.M.C. retired through a broken cam gear. Greig (Sunbeam) charged a wall in avoiding a child, and so damaged his machine that it was impossible to carry on. The Clynos and Reed's Dot were withdrawn as a protest. Read (2¾ Ready) was forced to retire through the rider's illness.

Fearful stories were current in advance of the "tunnels" on Tuesday's run. They were said to be situated on a 1 in 5 grade, measure half a mile in length, and be very greasy. Even the men who had electric lighting would be lucky to climb them. Actually they were not very steep and so short that one could easily steer by the light from the two ends. The surface felt rather sticky, but nobody came over.

Overheard on Harden Bank.

First Local Operative: "It's worth dropping a day's wage to see this."

Second Local Operative (with great contempt): "A day's wage! Ah've missed all t'week to see the Trials here and there."

The Scott Sociable on Harden Bank.

Two Scott sociables visited the route at various points during the week. They were known to the crowd as the Scott "crabs." One of them made a neater, quieter, and faster ascent of Harden Bank than any competing three-wheeler; but *didn't* it smoke!

Towards the close of each day's run, it was amusing to see competitors cleaning up their mounts. Two well-known passenger-carrying teams were particularly noticeable in this respect. This cleaning-up process was quite a desirable hobby, since it gave an impression of smartness, and deceived no one as to the mudguarding of the machines.

Packman (Matchless sc.) broke a handle-bar after all the hard work of Friday's run was over. However, he decided to attempt a finish with an extemporised arrangement fixed to the forks.

A Northcountryman on Thursday night proffered some kindly hints about the rough surface on Hardon Bank in Friday's run. "Ca canny, lads, and mind your rims." One shaken competitor retorted, "Mine is an irregular dodecahedron already."

George Dance had neat cast aluminium valve spring covers, which he told us effectually excluded all grit and consequently saved wear on the valve guides.

Much credit is due to Mr. T. W. Moffat, the manager of the motor cycle department of the Cleveland Car Co., Ltd., for the garage arrangements. Mr. Moffat is an old six days competitor, and had business permitted he would have ridden again this year. The remainder of the machines were housed in a spacious building attached to Smith's garage.

The omission of Rosedale Abbey Hill caused grievous disappointment to the public. One man had come 200 miles to see the climb, and altogether about 1,000 spectators had assembled. Some of the crowd were so disgusted that they threw their A.C.U. badges over the hedges.

Some of the passenger machines took from one to three hours to climb Summer Lodge. It is freely questioned whether any of the solo machines made a technically clean ascent. Certainly no man attempted to keep his feet on the footrests. On the other hand, Douglas Alexander is reported to have achieved a miraculous ascent on his Enfield.

Organisation of the Trial.

The organisation of the trial reflects great credit on the A.C.U. Its policy is doubtless open to criticism; but, whatever opinions may be held on that point, the trial was excellently planned and run. The provisions for the riders' convenience and comfort were most successful, the route marking was flawless, and both the trade and the public owe the Union a substantial debt of gratitude for the furtherance of the sport and industry.

In recognition of the plucky performance of Mrs. O. M. Knowles (Norton), who was run into by a non-competitor on the fifth day of the trial, the competitors are presenting her with a special prize. The suggestion emanated from T. C. de la Hay and G. Dance, whose numbers were near that of Mrs. Knowles, and they were therefore able fully to appreciate this intrepid lady's fine riding. The Editor of *The Motor Cycle* was invited to carry the matter through, and over a hundred subscribers were readily forthcoming.

On Thursday evening there was nearly a shortage of checkers at the finish, but by the help of a steam lorry and a hectic ride on the carrier of Egginton's 8 h.p. Sunbeam, Alec Ross reached Darlington to time.

At Chapel-en-le-Frith the Ferodo people had a banner across the road, and handed the riders souvenirs as they passed.

Before the men reached Harden Bank some of the spectators began to remove loose rocks from the best track. A rival party replaced them. There is one famous loose boulder, weighing some 60 lb. Its proper place is in the middle of the second hairpin, and the local clubmen always see that it is in position before any competition takes place on the hill.

The A.C.U. officials have missed some glorious openings for climbing tests. They never noticed the gigantic slag-heaps near Nenthead. These have a gradient rather worse than 1 in 1, and a surface so loose that even the Parsons chains used by the Morgan team would fail to make tyres grip.

Park Rash, the ascent of which troubled so many on Monday, had to be descended on Friday. The burning question in the official garage on Friday morning was, "Do we have to make clean descents of Park Rash?"

Tom Peck had the misfortune to damage a fork on Thursday on the top of a lonely moor.

The Triumph team was equipped with a new front mudguard deeply valanced behind the forks and having wide mud channels formed in the front part of the guard. These channels terminate in a blank end, but a drain is provided by channel section stays which project downwards well below the wheel spindle.

A Scott rider, whilst accompanying the Trials, saw a point policeman put up his hand, and stopped. "Excuse me, sir," said Robert; "can you tell me how to get such a healthy crackle on a Scott? I've got one myself, and it doesn't sound a bit like yours." Quoth the rider, "Well, the fact is I've shed my exhaust pipe!"

Darnton, the popular Indian rider, had engine trouble on Friday, and retired. Colver (Matchless-M.A.G.) had a gudgeon pin work loose, and forced him to retire.

Brooklands.

F. W. Applebee's gear lever on his Levis went wrong on The Snake on Friday, leaving him with top gear only. He got to Brooklands, however.

It was distinctly hard luck for Stobart's James to develop engine trouble on Brooklands.

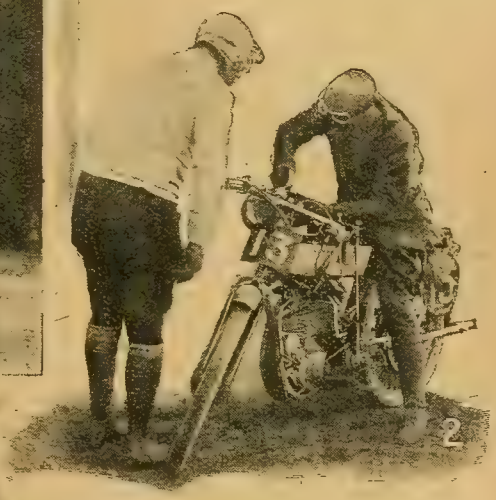
A large number of spectators and fellow competitors sympathised with Kaye Don for his bad luck in having one cylinder go "groggy" on Brooklands. He did most of his speed test on one cylinder.

Redvers Johnson (4½ Humber) developed a speed on Brooklands which was too high for proper control with touring bars. He fell and badly cut his hands.

A Cowey horn lay in the centre of the track, and actually caused a competitor to fall.

Scenes in the French Grand Prix.

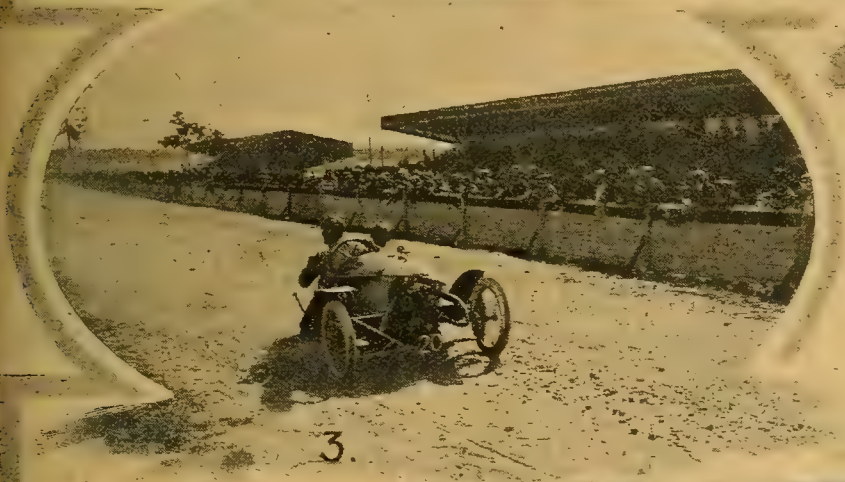
Held on the Circuit de la Sarthe at Le Mans. The winning Machines were an Alcyon Motor Cycle and Major Cycle Car, both French Productions.

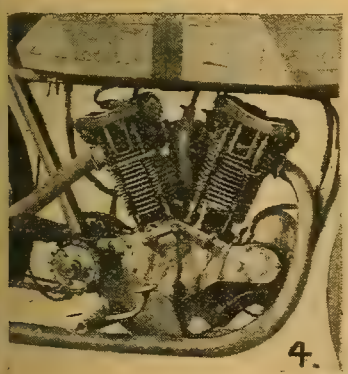


(1) The winner of the cycle car Grand Prix (Violet) rounding a bend on his Major, a machine engined with a 10 h.p. two-stroke motor.

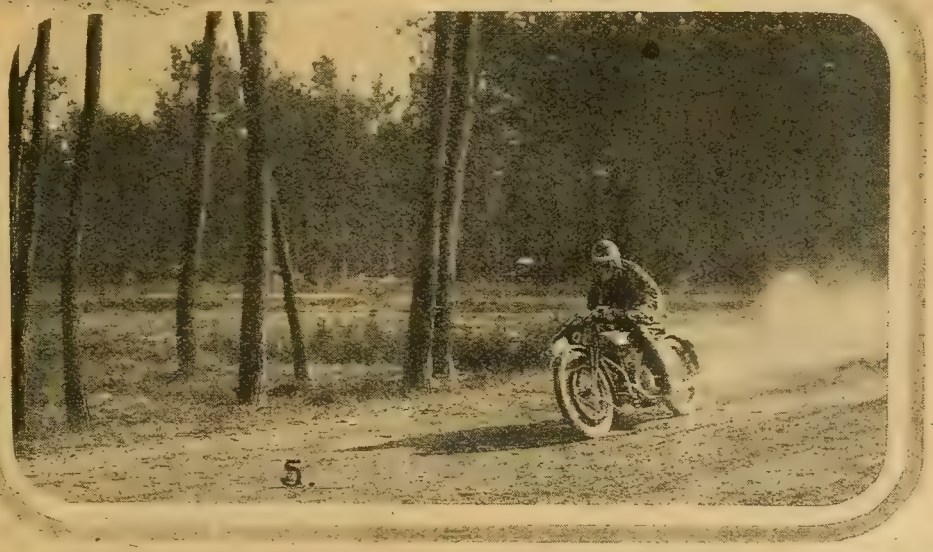
(2) Lucky 13. The winner of the 500 c.c. class, Jolly (Alcyon) filling up with petrol.

(3) E. B. Ware passing the grandstand on his Morgan. He made fast time until assailed by engine trouble.





(4) The overhead valve engine of the winning Alcyon.



(5) An English competitor at speed. Alexander on his Douglas.

Clyno Deliveries Unaffected.

We understand that the Clyno Co. has gone into voluntary liquidation, but that this will not interfere with deliveries.

Motor Cycles in Germany.

The first international motor cycle races in Germany will be held at Dresden on the 18th and 19th.

Australian Motor Spirit.

A company is being formed in Australia to purchase the rights to manufacture the South African motor spirit "Natalite." It is estimated that the fuel can be produced to sell at 2s. per gallon retail.

Trade in Chili.

The editor of a Chilian journal advises us that motor cycles made in his country are now moving rapidly, and that several clubs are already in existence. Unfortunately British manufacturers are not taking full advantage of the possibilities of trade in this distant South American republic, with the result that most of the machines entering the country are products of the U.S.A.

Weights.

The lightest machine in the Six Days Trials was Bischoff's 2½ Clyno which weighed 175 lb. The majority of the other two-strokes weighed under 200 lb., but those of the four-stroke variety varied from 200 to 252, while the little three-cylinder radials were just 2 cwt. F. A. Applebee's A.B.C. scaled 294 lb., the Triumphs were under, and the Sunbeams just over 300 lb. A full list of the weights was given in the table of results in last week's issue.

Hill-climbing to Musical Accompaniment.

Quite an innovation in the management of club events was introduced by the Bradford M.C. and L.C.C. at a hill-climb on Rosedale Abbey Bank, which was held on the day following the Six Days Trials. In order to provide continuous entertainment for the 2,000 spectators who were present, the club specially engaged the Great Ayton Prize Band to give selections during the afternoon. This method of making a club event a "popular" one, with an appeal to others than motor cyclists, is a delightful example of useful propaganda. Although the hill was deleted from the Six Days Trials at the last moment, thirty-two competitors ascended it in the Bradford Club event. The results were as follow: Solo class.—1, W. Gilyard; 2, H. Dawson; 3, G. Townsend (all on P. and M.'s); 4, A. Holdroyd (3¾ Scott). Sidecar Class.—1, J. Conchar (8 New Imperial sc.); 2, P. Shaw (6 P. and M.).

Liverpool Reliance Cup Trial.

Entries for this popular annual one-day reliability run close on Saturday morning, and riders who wish to compete should write at once to the hon. sec., Mr. N. C. Sclater, 1, Earlston Road, Wallesey. As usual, the route is directed towards North Wales.

Taking Numbers.

The annoying pastime of number taking by children unfortunately appears to be on the increase, and likewise the accidents caused by youngsters who are too intent on their observation of passing vehicles to notice other traffic. The impression that a collection of two hundred motor car numbers is entitled to a reward should be removed from the minds of children, the easiest way being for the headmasters of all schools to announce this fact; it may save lives in the future.

Reminiscences.

Receiving the other day a catalogue from Veloce, Ltd., for review, we noticed embossed on the envelope a Kelecom engine. It may be recalled by our older readers that this engine was fitted to the Ormonde motor bicycle, one of the very early makes which was on the market from 1902 to 1904, and, in its day, extremely popular.

The early model had the engine between the saddle tube and the rear forks, with the sparking plug projecting in a forward direction. In those days pedal assistance was frequently required, and this little engine, which was 2¾ h.p. (75×80 mm.), drew one of the first sidecars seen on British roads, and which was made by Components, Ltd. Naturally much more pedal assistance was needed when a sidecar was fitted, and as the rider pedalled, unless he were very careful, he got violent shocks in the leg from the sparking plug terminal.

The frame to which the Kelecom engine was fitted was designed by Mr. Percy J. Goodman (the designer of the present-day Velocette and the older 2½ h.p. four-stroke Veloce), who was then a boy. Many years ago Messrs. Veloce, Ltd., purchased the goodwill of the Ormonde Cycle Co., and that is why the Kelecom engine is still embossed on their envelopes.

A Dastardly Trick!

A delightful piece of evidence was forthcoming in a recent case heard before the Kingston bench. The defendant was a motor cyclist who was called upon to stop owing to his rear lamp being out. Instead of so doing he callously "*opened his exhaust valve and rode away at an increased pace.*" Reminiscent of the old discussions on "does a machine go faster with exhaust valve partly raised?"

£200 Reward for a Motor Cycle.

One of the specimen Pullin Groom motor cycles has been stolen in France. Only a few have been made, one of which was sent to America and another to France. It was while the latter machine was at the Gare du Nord that the theft took place. Anyone giving information which may lead to the recovery of the machine is asked to address communications to the A.A. and Motor Union, 39, Rue de la Chasseur-d'Antin, Paris.

Dangerous Cross Roads near Worcester.

Very dangerous cross roads exist at the village of Ombersley just outside Worcester. There have been many accidents, of which a number have been fatal, and there has recently been several cases of prosecutions for passing these cross roads by motor at high speed. On Tuesday five motorists had inflicted upon them, at Worcester, fines varying from 50s. to £5 for this offence.

A Scottish Club Team Trial.

The Glasgow Western M.C.C., as trustee of the "John Bull" Challenge Cup, has organised a club team trial, which will take place on Saturday. Each team will consist of two solo and two sidecar machines, and a circular course of thirty miles must be completed twice non-stop at an average speed of 18 m.p.h. The route is as follows: Amulree Hotel, Glen Quaich, Kenmore, Aberfeldy, Amulree Hotel. The start is at 1.30 p.m.

Dutch Interest in the Six Days.

That sporting Dutchman, M. Nic Jannink, president of the Dutch M.C.C., in a chatty letter redolent of motor cycle enthusiasm, says the Dutch boys followed with the keenest interest the Six Days Trials. He says: "The trial demanded from the riders greater mastership of the handle-bars and controls than did the Dutch Trial with its split minutes and stopping watches, and I am sure next year the Dutch team will make strange eyes." If any of the Six Days hills are included in the Anglo-Dutch Trial next year, the Dutchmen will certainly have some fun.

The rose bowl presented to Mrs. Knowles by her fellow competitors in recognition of her plucky performance in the recent Six Days Trial.

Two-stroke Consumption.

The petrol consumption of the winning Major two-stroke cycle car in the Grand Prix is said to have been twenty-nine miles to the gallon over the course of 170 miles, a fine performance for a two-stroke engine of 10 h.p. under high-speed racing conditions.

A Works Trial.

On the 26th of this month the motor cycle section of the Levis Athletic Club will hold a one day reliability trial for single geared belt drive Levis machines. The course will be in the Birmingham district, and, while sporting will not be impossible, it will be decidedly interesting to observe the manner in which the personal element affects the performances of a number of riders using identical machines.

Amended Six Days Results.

The following amendments have been issued by the A.C.U. with regard to the results of the Six Days Trials. Our readers will remember that these preliminary results were published in *The Motor Cycle* of September 2nd:

G. L. White (5 Rover), stop on hill, 5; total marks lost, 5. W. L. Guy (3¾ Scott), +5. W. Westwood (4 Triumph), lost 8.

Club Team Prize.—Worcester and District, 26 marks. No other club qualified.

N.E.A.A. Special Prize.—D. Robb, +5 marks; W. C. Thomson, —4; S. Turvey, —6.

D.R. Special Prize.—C. P. Wood, +5 marks; H. Taylor, —3; A. F. Guthrie and E. Williams, —5 (equal).

Private Owners' Prize.—R. W. Duke's team, —15 marks; Ellis's team, —41.

The Grand Prix.

We had recently an interesting conversation with E. B. Ware after his return from Le Mans. He had indeed hard luck during the Grand Prix. He started last, but in the third lap he was only two minutes behind the leader. In the fourth lap Ware led the field, and was doing over seventy-five miles an hour when misfiring developed, and on stopping he found that a lump of metal was blown clean out of one cylinder. He then returned to the Grand Stand, cut out the defective cylinder, and covered ten laps on the other one at an average of forty miles an hour and finished the race.

1921 London-Edinburgh.

The 1921 London-Edinburgh run will take place over a course still more difficult than that traversed during this year's run. The Motor Cycling Club is aware of the necessity for restricting the entries for these competitions, which are becoming so enormous as to be practically unwieldy. For next year's event the entry fee will be £2 2s., and there will be but a short interval between the issuing of the announcement of the run and the dates of closing the entries and for electing new members who join the club specially for this competition.

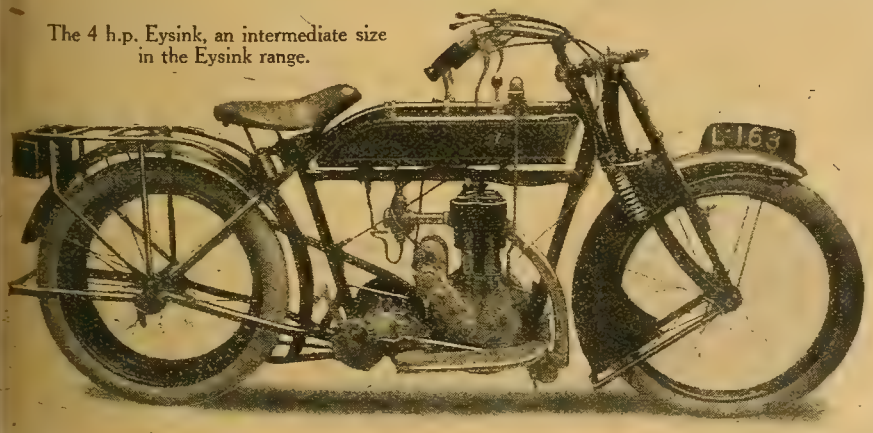
The Motor Cycling Club regrets that it is unable to make any arrangements as regards hotel accommodation or feeding *en route*, and it will be left entirely to competitors to cater for themselves.

AT ST. ANDREWS.

The youngest competitor in the Scottish Speed Championships, held at St. Andrews last Saturday, R. J. Mackie (2¼ h.p. Royal Enfield). He put up a plucky ride.

The 1920 Eysink Motor Cycles.

Three Models manufactured by a Well-known Dutch Firm.



The 4 h.p. Eysink, an intermediate size in the Eysink range.

HOLLAND has a very large number of motor cyclists in proportion to its population, and perhaps in no other land does one see so many countries represented by the machines used. British and American motor cycles predominate; there is also a fair sprinkling of Belgian, French, and German productions, and last, but not least, are those manufactured in Holland. Among the latter the Eysink is one of the best known, and the three models representing the house of D. H. Eysink, of Amersfoort, more closely follow the lines of British machines than those of Holland's nearer neighbours.

The smallest of the trio is a 3 h.p. machine, having a single-cylinder engine of 74 mm. and 85 mm. bore and stroke respectively. The piston displacement is 365 c.c. The tyres fitted are 26×2¼in.

All Single-cylinder Models.

Next in order of size is the 4 h.p. model, which has a bore and stroke of 80 mm. and 85 mm. respectively, which gives a capacity of 427 c.c., and 26×2½in. tyres are used.

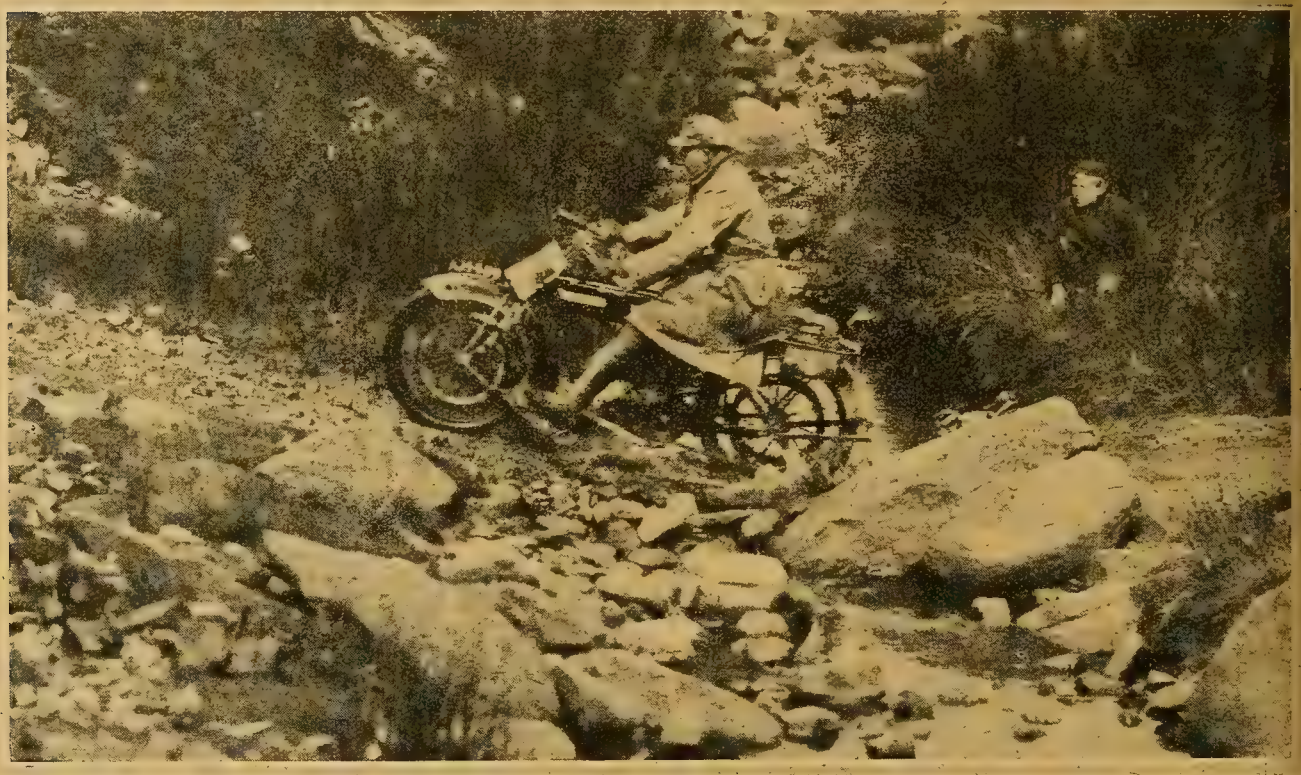
The largest model is nominally rated as 5 h.p., and has a bore of 85 mm. and a stroke of 95 mm., the capacity being 539 c.c.

All models have outside flywheels, and are fitted with a two-speed countershaft gear and a front fork of Eysink design.

Amac carburetters are among the British accessories embodied.

A SCRAMBLE ROUND YORKSHIRE.

Impressions of the Scott Trial, by a Competitor. Entries, 132; Starters, 86; Finishers, 60.



H. E. Ellis (B.S.A.) between Hebden and Grassington The "road" at this point is narrow and rough.

"THIS is not a race but a tragedy." Such is the description of the event on the official programme. Fortunately, the description was applied in the spirit of cheerful good fellowship which pervades everything pertaining to the Scott trial. The organisers are frankly out to provide a day's sport, and to prove what *can* be done by man and motor cycle. One might say that the test is admirable as an Overseas trial, but, though equally villainous or worse tracks undoubtedly exist in other parts of the world, it is certain that they are not used by motor cyclists, except in cases of very special need. These remarks do not, of course, apply to the whole route, parts of which are rideable, and parts even are excellent main road, but such sections as that near Grimwith Reservoir and the moor tracks near the cupola works (disused lead mines) must be experienced even to be imagined.

Shortly before ten o'clock competitors gathered in Burnsall in a steady wetting mist, and all the cheery optimism of the organisers was needed to save the spirits of the competitors from becoming unduly damped. The depth of the watersplashes grew till one began to think of lifebelts. The surface of Darnbrook was so slippery as to be unclimbable. Park Rash and the Scar raised our deepest fears, and it was pointed out that only two riders had got across the Nid with engines running in the previous year.

Such is the atmosphere at the start of most big trials, and everyone knows that the Scott trial is the stiffest of the lot.

A glance round the competing machines revealed that Scotts and Triumphs were easily in the majority, though P. and M.'s, Wilkins, and Kingsburys each had three or four representatives. Manufacturers, with the exception of those from Yorkshire, were conspicuously absent, for a trial of this description brings out the sporting rider rather than the stock trade teams.

Stakes to denote the route.

At 10 sharp away went Donald Moore on his Scott, followed at minute intervals by the next men. Waddington's Triumph was barely out of sight before his belt fastener gave trouble and caused a stop. Soon it was our turn to get away, and in a few moments the start, from our point of view, lost all interest, and only the road ahead mattered. The good roads soon deteriorated, and a long rough descent had its climax in Dob Park splash. A pack bridge—on which spectators crowded—spans the stream, and the splash is entered and left by steep paved banks. Added to this there are boulders in the bed. A competitor was firmly embedded in the stream when we arrived, only to keep him company, but Waddington came through safely, though his belt caused trouble on the subsequent hill. Shortly after this some of the early numbers went astray, as there were not sufficient wheel tracks to act as a guide, and some of the arrows had been destroyed during the night by wind and rain. The route-marking as a whole was excellent, and it was purely bad luck that the effects of the elements caused a certain amount of trouble.

Grease was abundant and horrid, and hills, well, one lost count of them, though the descents were perhaps the most trying, and the moorland ruts and wet grass caused many spills. Lashed by the strong wind there were white capped waves on Grimwith reservoir, but this same wind blew away the rain clouds and helped to dry the course.

After skirting the end of the reservoir, all signs of a track disappeared, and the course was indicated by stakes driven into the ground at intervals. At first the route was merely grass, but it became rougher and boggier until it appeared that neither man nor machine could stand another jolt; added to this, a very slight deviation from the staked course inevitably led to a bogged machine. The stretch culminated in two observed mud splashes of such a depth that machines dropped on to their crank cases and balanced precariously on the edge until shoved off into the slimy depths.

Next came more grass and stones and a welcome descent to Burnsall for lunch and an hour's rest. By this time the sun was shining brightly, and competitors arrived hot and weary after much hard

E. Sykes (Triumph) in Dob Park watersplash. Observe the boulders.

exercise amongst the rough. C. P. Wood's time for the morning section was spoken of with bated breath; but not a few machines arrived with bent footrests, burst silencers, and other minor defects.

Hebden Ghyll! How is it to be described? Picture to yourselves a river bed partly filled up with stones, heather roots, and an assortment of rubble—all this on a steady upward grade with intervening bits of the genuine river, water and all. It was at such a spot that a cinematograph operator chose to do his worst, and he at least must have had much amusement. At one place one climbed a slag heap sideways! Further on the track entirely disappeared, amidst the ruins of some old lead mines, and stakes once more showed the way. Hills followed. Grass hills, stony hills, long hills, steep hills, all sorts of hills, plus many gates and much three-rut track. Park Rash was almost a relief. The hill was in good condition, and one wondered how it ever came to be a bonus hill in the A.C.U. Six Days Trials.

Darnbrook and Deadman's Hills.

Darnbrook belied the prognostications of the pessimistic, and proved an easy climb, and the crossing of the Nid was nothing like so terrifying as its approach down Deadman's Hill. For sheer discomfort this was perhaps the worst bit of the course, a really steep descent and crossed by innumerable gulleys, so deep that if taken slowly the wheels "chocked" and stopped the machine.

After the Nid comes the Scar, a hill of terrifying aspect and rough, rutty surface. It includes one hairpin which is the genuine article, and brings one back on one's tracks on a stiff gradient. This hairpin, by the by, is invisible until the last moment, being hidden by a bank.

There followed a stretch of good, but twisty road, over which we had been warned that the police were active; then a selection of grease, a watersplash, and Middletongue, the last observed hill. Grease and ruts, followed by loose stones, formed the surface of this final test, and we can vouch for the fact that one competitor at least tested the solidity of the stone wall on the left of the road and found it firm.

A grand road to the finish and a strong head wind completed the most strenuous trial ever held, and a jolly party sat down to tea and discussion of the day's events.

As reports from the observed spots came in, the energetic officials worked out results, and to relieve the tedium of the wait, C. P. Wood, W. L. Guy, and one or two others, afforded much amusement to the crowds by crossing and recrossing the Wharfe below Burnsall Bridge. So quickly were results worked out that the main awards were announced at Burnsall before the party broke up, and Maj. Watling made a popular speech alluding to the excellent organisation and the sporting spirit of the competitors, also to the fact that over £35 had been cleared for St. Dunstan's Hostel by the sale of programmes. This sum was considerably augmented later on by the sale of other items (including a policeman).

In the evening the Scott Co. entertained many of the riders at a dinner and sing-song at the Middleton Hotel, Ilkley: a few speeches, a few stories, and a few songs. So ended a happy, sporting, and well-organised event.

AWARDS.

SCOTT TROPHY (FOR BEST AMATEUR TEAM).

Sheffield and Hallamshire: F. C. Waites (4 Triumph), E. H. Wheatley (4 Triumph), and J. O. Vessey (4 Triumph).

MYERS TROPHY (FOR BEST TRADE TEAM).

Scott Team No. 1: C. P. Wood (3¾ Scott), W. L. Guy (3¾ Scott), and H. Langman (3¾ Scott).

BEST TEAM TRADE AND AMATEUR MIXED.

Harrogate: A. Hill (4 Triumph), W. E. Grange (4 Triumph), and G. Hill (3¾ Scott).

VINTER CUP (BEST AMATEUR PERFORMANCE).

W. Moore (3¾ Scott).

SCOTT STAFF CUP (BEST TRADE PERFORMANCE).

C. P. Wood (3¾ Scott).

MELANO CUP (BEST PERFORMANCE UNDER 350 c.c.).

G. W. Wilkin (2¾ Wilkin).

CONSOLATION PRIZE.

C. J. Nicholls (4 Triumph).

B. Hill (Scott) passing through the roads of the ruined lead works, which constituted part of the route.

A Scramble Round Yorkshire.—

Finishers, showing total Marks gained.

SCOTT.

C. P. Wood, 243 marks gained; H. Langman, 235; W. Moore, 229; W. L. Guy, 222; G. Hill, 218; A. Holdroyd, 210; G. Clapham, 206; R. W. Stanfield, 199; E. Wasling, 192; A. E. Budd, 188; J. S. Duxbury, 187; G. A. Reed, 185; P. Moore, 182; T. P. Galway, 181; W. Smith, 170; T. Twentyman, 166; B. Rigg, 166; A. Mercer, 164; G. A. Nunneley, 151; Capt. Oliver, 148; A. C. Verity, 137; F. B. Roper, 132; S. Ashby, 121.

TRIUMPH.

H. Pattison, 223 marks gained; W. E. Grange, 221; D. Hoggarth, 206; H. S. Moorhouse, 203; W. Backhouse, 201; A. Hill, 201; F. C. Wates, 195; W. T. Brand, 186; E. H. Wheatley, 181; M. Sykes, 175; E. Jones, 168; H. D. Teage, 166; C. R. Waddington, 162; G. Grundy, 159; T. O. Veasey, 158; B. S. Dewhirst, 157; C. M. Green, 148; E. C. Ecroyd, 146; A. R. Naylor, 141; T. Baxter, 135; C. B. Sangster, 135.

P. AND M.

G. Townend, 182 marks gained; T. G. Bullus, 167; W. Drake, 156; H. Dawson, 130.

DOUGLAS.

S. R. Wright, 145 marks gained.

WILKIN.

G. W. Wilkin, 160 marks gained; T. C. Coney, 157; F. E. Palmer, 135.

A.B.C.

L. A. Runton, 150 marks gained.

ARIEL.

A. C. Thornton, 171 marks gained.

B.S.A.

H. E. Ellis, 224 marks gained; S. A. Fernley, 167.

NORTON.

T. A. Whalley, 168 marks gained.

BLACKBURNE.

S. Kirkham, 104 marks gained.

SUNBEAM.

—. Moffett, 156 marks gained.

Competitors were supposed to average 20 m.p.h. over the course, and, marvellous to relate, five men accomplished this feat. Fifty marks are awarded for this speed, and one mark deducted for each minute in excess of schedule time. Needless to say, in many cases the whole fifty marks disappeared.

A paucity of protests and grumbles is a welcome feature of such sporting events as the Scott trial. To "finish" is the one idea of most competitors, and, if this is achieved, the resulting glow of satisfaction is sufficient to remove all idea of complaint.

G. W. Wilkins's win in the 350 class is a fitting prelude for his "round the coast" ride, which is fixed for September 8th. Any 350 c.c. machine which can finish in the Scott trial deserves much praise

A.C.U. SIX DAYS TRIALS.

Speeds Accomplished in the Half-hour Test at Brooklands.

IN our last issue the provisional results of the 1920 Six Days Trials formed an appendix to the complete report. The medal winners have now been confirmed by the A.C.U.

The Motor Cycle table showed the weights of the machines, marks gained or lost on hills and in the silence, speed, and brake tests, also marks deducted under the heading of "condition" at the finish of the trial. It will be recalled that 133 competitors started, and that eighty-eight gold, five silver, and a bronze medal were awarded. Below will be found the speeds attained by the individual riders during the half-hour speed trials which took place on Brooklands on the last day. It should be borne in mind that these speeds were attained after 918½ miles of most difficult going in Yorkshire and Northumbria.

CLASS A.—MINIMUM SPEED 25 M.P.H.

A speed of not less than 25 m.p.h. had to be maintained by the 275 c.c. machines for half an hour. This was easily done by all except one; indeed, the speed of the miniature machines was exceptionally high. The Velocettes did extraordinarily well, E. Goodman exceeding 40 m.p.h., while G. Kuhn (2¼ Levis) averaged 36.5 m.p.h.

Rider and Machine.	Speed, m.p.h.	Marks Lost.
R. H. Baxter (2¼ Radco)	30.68	—
S. Jones (2¼ Velocette)	32.52	—
H. L. Hanks (2¼ Royal Enfield)	29.72	—
G. Denley (2¼ Velocette)	32.31	—
W. L. Handley (2¼ O.K.-Junior)	26.29	—
G. Kuhn (2¼ Levis)	36.56	—
J. F. Lidstone (2¼ James)	21.60	20 (15 min., only 2 laps)
E. Goodman (2¼ Velocette)	40.63	—
E. Porter (2¼ Levis)	30	—
H. P. Knowles (2¾ Hobart)	31.91	—

CLASS B.—MINIMUM SPEED 30 M.P.H.

Here again only one machine failed to average the required speed, but none were noticeably faster than the preceding "baby" class. J. W. Wills' (2¾ Verus) performance is noticeable, however, and speaks well for the tune maintained by his outside flywheel Blackburne engine.

Rider and Machine.	Speed, m.p.h.	Marks Lost.
B. Kershaw (2¾ Verus)	36.12	—
F. J. Price (2¾ Diamond)	40.36	—
R. B. Clark (2¾ Coulson)	36.34	—
J. Wills (2¾ Verus)	40.07	—
L. A. Bees (3½ Beardmore-Precision)	27.54	8
L. Tonks (2¾ New Imperial)	33.50	—
A. G. Cocks (3½ Beardmore-Precision)	36.28	—
H. Greaves (3½ Beardmore-Precision)	35.60	—

CLASS C.—MINIMUM SPEED 35 M.P.H.

The 500 c.c. machines were required to do 35 m.p.h., which speed the majority exceeded with a fairly large margin. Collectively, the Sunbeams made the best showing in this class, two of their number exceeding 44.5 m.p.h.

Rider and Machine.	Speed, m.p.h.	Marks Lost.
F. A. Applebee (3 A.B.C.)	43.14	—
N. Rycroft (4 Triumph)	42.91	—
G. Dance (3½ Sunbeam)	44.79	—
F. Townshend (3½ Sunbeam)	40.16	—
A. S. Guthrie (3½ Sunbeam)	42.21	—
F. J. Fieldhouse (3½ N.U.T.)	41.46	—
R. C. Winn (3 A.B.C.)	41.14	—
E. A. Edwards (3½ N.U.T.)	39.70	—
W. C. Thomson (3½ N.U.T.)	44.31	—
T. C. de la Hay (3½ Sunbeam)	44.51	—
D. Robb (3½ N.U.T.)	42.69	—
G. Featherstonhaugh (3½ Rover)	26.11	14
H. F. Edwards (3½ B.S.A.)	37.57	—
G. A. Strange (3½ James)	40.15	—
W. G. Harrison (3½ Sunbeam)	33.05	20 (19 min. only)
H. M. Batten (3½ P. & M.)	39.70	—
F. A. Longman (3½ Ariel)	40.70	—
G. M. Townsend (3½ P. & M.)	38.58	—
J. J. A. Dias (3½ P. & M.)	39.76	—
Capt. D. Barton (4½ Dunelt)	35.09	—

CLASS D.—MINIMUM SPEED 38 M.P.H.

The average speed demanded of the 750 c.c. solo class was quite high enough for comfort, since it is (*pace* the local speed merchants!) somewhere in the neighbourhood of maximum with the average touring machine. Actually 44 m.p.h. would not have been too high, for the best speed in the class was attained by G. Hill (3¾ Scott), who did 47.73 m.p.h., and this was almost equalled by H. Pattison (4 Triumph), who accomplished 47.27 m.p.h.

Rider and Machine.	Speed, m.p.h.	Marks Lost.
G. L. White (5 Rover)	44.23	—

H. Langman (3¾ Scott)	45.72	—
C. Moser (4 Triumph)	42.13	—
E. Cross, M.B.E. (4 Triumph)	43.02	—
D. A. Atkin (5 Rover)	46.19	—
W. L. Guy (3¾ Scott)	43.60	—
R. W. Duke (4 Triumph)	43.25	—
H. Pattison (4 Triumph)	47.27	—
L. L. Sealey (4½ B.S.A.)	40.63	—
W. Westwood (4 Triumph)	42.76	—
F. Turvey, Junr. (4½ B.S.A.)	44.67	—
H. Taylor (3¾ Scott)	43.56	—
G. Hill (3¾ Scott)	47.73	—
H. Green (4 Triumph)	43.01	—
F. G. Edmond (4 Triumph)	45.21	—
L. Crisp (4½ Humber)	44.59	—
H. S. O. Evans (4½ Humber)	46.15	—
E. R. Johnson (4½ Humber)	39.51	—
L. Newey (4½ Ariel)	36.75	7
J. L. Scott (4½ Ariel)	40.03	—
W. Chambers (4½ B.S.A.)	41.85	—

CLASS E.—MINIMUM SPEED 40 M.P.H.

Neither of the 1,000 c.c. solo machines qualified.

Rider and Machine.	Speed, m.p.h.	Marks Lost.
V. Gayford (6 Zenith)	40.77	20 (2 laps only, 8 min.)
Kaye Don (6 Zenith)	32.56	13

CLASS G.—MINIMUM SPEED 24 M.P.H. (SIDECAR).

Only one sidecar machine below 500 c.c. capacity competed, and it qualified for full marks in the speed test with the greatest ease; a splendid result for the smallest engined sidecar outfit in the trials.

Rider and Machine.	Speed, m.p.h.	Marks Lost.
P. Pehrson (4½ Dunelt)	31.43	—

CLASS H.—MINIMUM SPEED 28 M.P.H. (SIDECAR).

All the 750 c.c. sidecars seemed capable of exceeding the demands made upon them; their speeds were very uniform, ranging from 32 to 35 m.p.h.

Rider and Machine.	Speed, m.p.h.	Marks Lost.
Cyril Williams (6 A.J.S.)	32.24	—
J. Cooper, Junr. (6 A.J.S.)	33.62	—
H. R. Davies (6 A.J.S.)	34.69	—
S. Wright (4½ Humber)	35.40	—
A. L. Cranoh (5 Rover)	32.15	—
E. Williams (6 A.J.S.)	34.79	—
A. Wade (6 A.J.S.)	32.44	—
G. E. Stobart (7 James)	35.29	—

CLASS K.—MINIMUM SPEED 32 M.P.H. (SIDECARS AND THREE-WHEELERS).

Some of the big twins did not exceed their required margin very widely; this, of course, being intentional in all probability. G. Packman's Matchless sidecar and D. Alexander's Enfield both deserve mention for being able to do ten miles more than the stipulated 32 m.p.h.

Rider and Machine.	Speed, m.p.h.	Marks Lost.
G. Packman (8 Matchless)	42.46	—
G. Knott (7 Matchless)	35.81	—
F. J. Ellis (7 Matchless)	34.89	—
G. D. Hardee (7 Matchless)	37.66	—
B. Bladder (8 New Imperial)	35.76	—
H. F. S. Morgan (8 Morgan)	41.07	—
T. J. Ross (7 Matchless)	37.90	—
W. E. Smith (8 Enfield)	38.56	—
H. Jepson (8 Zenith)	—	20 (Did not complete one lap)
D. Alexander (8 Enfield)	42.28	—
W. A. Fell-Smith (8 Blackburne)	35.40	—
R. Charlesworth (8 Zenith)	35.24	—

CLASS L.—MINIMUM SPEED 33 M.P.H.

The two 10 h.p. Morgans both exceeded the speed required.

Rider and Machine.	Speed, m.p.h.	Marks Lost.
S. Hall (10 Morgan)	36.95	—
F. James (10 Morgan)	42.61	—

THE 1920 OLYMPIA SHOW.

A Preliminary List of Exhibitors. The Trend of Design for Next Year's Market.

IT does not seem long since we were last in the throes of "The Show," and yet in a little time we shall again be in the midst of its hectic days.

Glancing over the preliminary list of exhibitors, we may indulge in a little forecasting of the general lines on which we may expect the design of the machines displayed to run. Reviewing the names of those firms wholly, or almost wholly, devoted to the production of motor cycles or motor cycle power units, we find that, out of a total of seventy-six, forty-two concentrate on the four-stroke types, while the two-stroke, despite its increasing success, is the single string of only twenty-two firms. In addition to these firms there are twelve manufacturers who are catholic in their selection of power units, and fit both two and four-stroke engines to their products. These figures are based, of course, on existing programmes, but (as is usually the case) there may be one or two designers with a carefully guarded change of policy.

When we come to the other forms of vehicles associated with the motor cycle field—the scooters, three-wheelers, and motorised bicycles—we find that the four-stroke engine again predominates. There are three makers of scooters; two favour the two-stroke engine and one the four-stroke. In the three-wheeler class there is one supporter of the two-stroke amongst six firms showing the runabout type of vehicle. Only two exhibitors are concentrating on motorised bicycles; and while one favours the four-stroke, the other evidently considers that for this simple type the valveless engine is to be preferred.

Detail Improvements.

So far as new developments are concerned, it is rather early to speak without "letting the cat out of the bag," but we may expect that although there will be few changes in engine design since the 1919 exhibition, there will be a general refinement of details. Chain drives may be seen in hitherto steadfast strongholds of the belt. Several manufacturers of lightweights will "cut in" to the light dual-purpose market. Detachable wheels, round-base rims, and efficient mudguarding will be seen in quarters where these fitments are long overdue; while last, but by no means least, the front rim brake will be almost universally discarded in favour of more satisfactory designs.

A Welcome New Comer.

Last Show introduced several newcomers to the industry, but this year there is only one name which is uncommon to the general mass of the motor cycling public; this is the Scott Autocar Co., Ltd., the presiding genius of which is Alfred A. Scott, and this exhibit will be visited with the greatest interest and curiosity by those who have heard of the brilliant designer's work on the Scott Sociable during the past five years.

Athough 1919-20 has been a period of trouble and unrest, the trend of development is now proceeding along more settled lines. Wild schemes have been dropped, pre-war influences and patterns have almost disappeared, and the few remaining "scooters" have all adopted seats! 1920 will really give us the *first* post-war Olympia Show!

The Principal Makes of Complete Machines and Sidecars (with Stand Numbers) at Olympia, November 29th to December 4th, 1920.

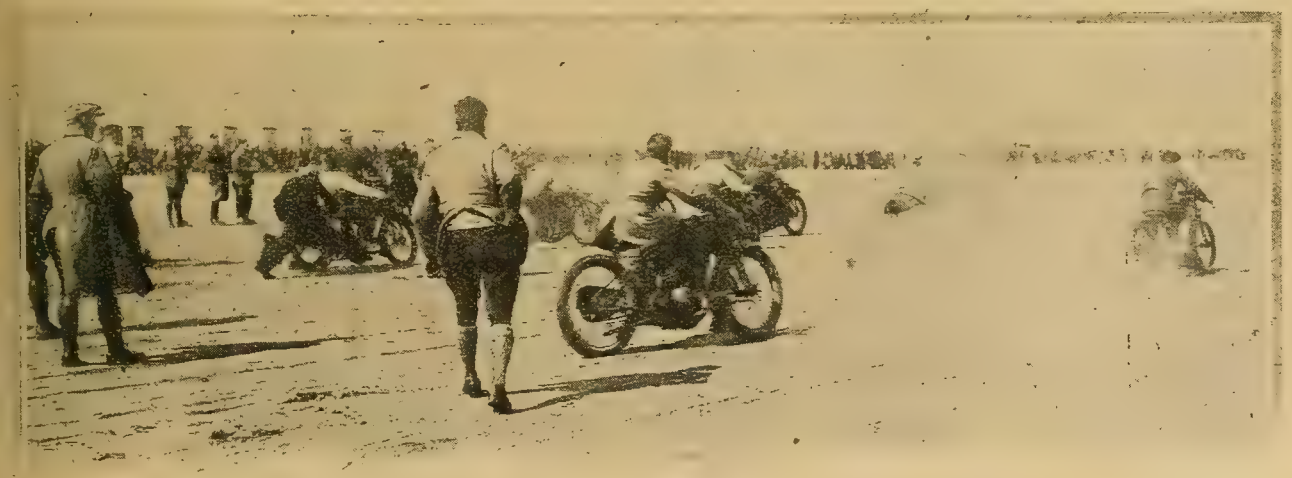
SPEED TRIALS ON THE SANDS AT ST. ANDREWS.

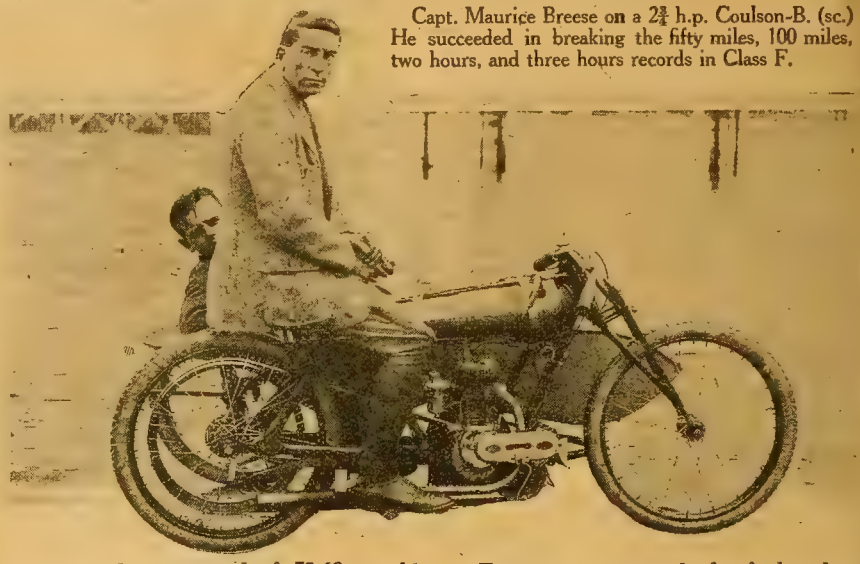


The start of the heavy weight class in the Scottish speed championships last Saturday.

Four Records Established in the Rain.

Success of the 2¾ h.p. Coulson-B. with Sidecar on Brooklands.

A VERY creditable performance was made by Capt. Maurice C. Breese at Brooklands track on Thursday last, September 2nd, when, riding a 2¾ h.p. Blackburne-engined Coulson-B. and sidecar, he established four new records in Class F for motor cycles and sidecars not exceeding 350 c.c. In view of the fact that during the three hours ride the rain fell incessantly, and that this attempt was the first appearance of the Coulson machine on the track, the average speed of 38.25 m.p.h. for that time must be considered to be exceptionally good.



Capt. Maurice Breese on a 2¾ h.p. Coulson-B. (sc.) He succeeded in breaking the fifty miles, 100 miles, two hours, and three hours records in Class F.

A Standard Engine.

The engine was a standard production, as also were the frame and components, while the only deviation from usual practice was the special single-geared transmission. A countershaft was slung between an extension of the front engine plates, and accommodated the chain sprocket and belt pulley, both of which were mounted on the near side. The gear reduction was 6 to 1, and the long belt, necessitated by the disposition of the pulley, did not, in the rain, show any appreciable signs of slipping. Starting at 12.15 p.m., Capt. Breese first established the 50 and 100 miles records. The former distance was completed in 1h. 14m. 30s. at an average speed of 40.26 m.p.h., whilst the latter distance was covered at a speed of 39.69 m.p.h. in 2h. 31m. 10⅘s.

The two hours run was covered at a speed of 39.53 m.p.h., and constituted a distance of 79 miles 122 yards, whilst in three hours a distance of 144 miles 1,344 yards was completed at an average speed of 38.25 m.p.h.

Two stops were made for fuel and one for a broken chain. The fastest lap speed was 42.35 m.p.h. Amongst the equipment used were the following: Canoelet sidecar, Flexi carburetter, Wood-Milne tyres, John Bull belt, Wakefield Castrol oil, Shell spirit, Cooke plugs, and E.I.C. magneto.

HILL-CLIMBING AT STILE KOP.

A Record Crowd and Fine Performance at the Birmingham M.C.C. Hill-climb.

STILE COP, near Rugeley, on the borders of Cannock Chase, was the scene of the Birmingham Club's twelfth annual hill-climb on Saturday last. The event attracted no fewer than 107 entries, notwithstanding the fact that it was open to club members only. Many of the best known riders in the sporting motor cycle world were competing, so there is little wonder that the crowd which lined the hill was a record one of from 1,500 to 2,000 persons.

Doubtless, having in mind last year's climb, the officials very wisely had the finishing tape 200 or 300 yards from the actual crest of the hill, in order to allow competitors plenty of time to pull up before reaching the bend and descending the other side.

A Three-cornered Struggle.

As the events were run off, it was realised it was a Sunbeam, A.J.S., and Norton afternoon, the various riders of these makes of machines trying their hardest to beat one another. So closely were they matched, that in class 6 G. S. Boston on a 2¾ A.J.S., and G. Dance on a 3½ Sunbeam, both climbed the hill in 39⅕s., being beaten by Graham Walker on a 3½ Norton by three-fifths of a second only. The event for the four fastest machines of the day would have been very exciting, as it was proposed to run the machines up the hill in pairs, in two heats. The police, however, unfortunately tabooed the idea, and the event had to be run off against the watch. G. S. Boston 2¾ A.J.S., G. Dance 3½ Sunbeam, H. W. Hassall 3½ Norton, and G.W. Walker 3½ Norton, were the four eligible to compete. Boston won the event in 40s., with Dance second in 40⅕s., Hassall third in 40⅘s., and Walker fourth in 42⅖s. Close times, but curiously enough all slower than the previous best made by each rider.

Fifths of Seconds.

The distinction between Boston and Dance was very fine, amounting to fifths of a second in each class, but Boston just managed to get the lead, and his bag for the afternoon amounted to four firsts and three seconds, whilst Walker took three firsts and one second. Dance took one first and four seconds.

The climb was over just after 5.30, and the officials of the Birmingham M.C.C., particularly Mr. W. H. Egginton, the hon. sec., are to be congratulated, as indeed they were on the hill, for the splendid organisation which enabled such a big entry to be run off so promptly. The detailed results are as follow:

CLASS 1 (for scooters).—1, J. E. Chamberlain (2¼ Autoglider), 69⅖s.; 2, C. R. Townsend (2½ Autoglider), 89⅖s.

CLASS 2 (for solo machines up to 250 c.c.).—On time: 1, R. E. Pugh (2¾ Levis), 55⅗s.; 2, F. J. Price (2¼ Diamond), 59⅕s.; 3, E. Smith (2¼ Cedos), 64⅘s. On formula: 1 and 2, same as on time; 3, H. R. Lane (2¾ Levis).

CLASS 3 (solos up to 300 c.c.).—On time: 1, R. E. Pugh (2½ Levis), 60⅗s.; 2, F. J. Price (2¼ Diamond), 61⅗s.; 3, A. Haden (2½ New Comet), 66⅕s. On formula: 1, R. E. Pugh; 2, J. F. Lidstone (2¼ James); 3, A. Haden (2½ New Comet).

CLASS 4 (for solos up to 350 c.c.).—On time: 1, G. Dance (2¾ Sunbeam), 41⅕s.; 2, G. S. Boston (2¾ A.J.S.), 44s.; 3, R. E. Pugh (2½ Levis), 53s.

CLASS 5 (for solos up to 499 c.c.).—On time and on formula: 1, G. W. Walker (3½ Norton), 39s. On time: 2, G. Dance (3½ Sunbeam), 39⅗s.; 3, H. W. Hassall (3½ Norton), 41s. On formula: 2, H. W. Hassall; 3, H. Petty (3½ Norton).

CLASS 6 (for solos up to 600 c.c.).—On time: 1, G. W. Walker (3½ Norton), 38⅗s.; 2, G. S. Boston (2¾ A.J.S.) and G. Dance (3½ Sunbeam), both 39⅕s.; 3, H. W. Hassall (3½ Norton), 39⅗s. On formula: 1, G. J. Baragwanath (4 Triumph); 2, R. A. Fawsett (4¼ B.S.A.).

CLASS 7 (for solos up to 750 c.c.).—Time awards only: 1, G. W. Walker (3½ Norton), 38⅗s.; 2, G. S. Boston (2¾ A.J.S.), 39s.; 3, H. W. Hassall (3½ Norton), 39⅗s.

CLASS 8 (for solo machines, unlimited c.c.).—On time: 1, G. S. Boston (2¾ A.J.S.), 38s.; 2, G. W. Walker (3½ Norton), 39⅕s.; 3, G. Dance (3½ Sunbeam), 39⅗s. On formula: 1, L. Darton Cuxon (5-6 Zenith); 2, G. J. Baragwanath (8 Zenith); 3, R. Bond (8 Zenith). Formula awards open only to machines over 750 c.c. in this class.

CLASS 9 (for the four fastest solo machines of the day). It was intended to run this class on the knock-out principle, but the police would not allow this; therefore times only were taken.—1, G. S. Boston, 40s.; 2, G. Dance, 40⅕s.; 3, H. W. Hassall, 40⅗s.; 4, G. W. Walker (3½ Norton), 42⅖. It is interesting to note that each competitor made better time in previous classes.

CLASS 10 (for sidecar machines up to 499 c.c.).—On time: 1, G. S. Boston (2¾ A.J.S.), 47⅗s.; 2, G. Dance, 47⅘s.; 3, L. Paynter (3½ Norton), 57s. Graham Walker broke a chain. On formula: 1, G. S. Boston; 2, G. Dance.

CLASS 11 (for sidecar machines, unlimited capacity).—1, G. S. Boston (2¾ A.J.S.), 46⅖s.; 2, G. Dance (3½ Sunbeam), 47⅘s.; 3, G. W. Walker (3½ Norton), 48⅗s. On formula: 1, G. E. Stobart (5-6 James); 2, F. W. Giles (6 A.J.S.); 3, R. Bond (8 Zenith).

During the event over 200 tickets were sold for the gymkhana which is to be held at the "George-in-the-Tree," Berkswell, on Saturday, September 18th, all proceeds from which will be given to the *Daily Mail* Christmas Tree Fund.

Helensburgh M.C.C.

The results of the last speed-judging contest are as follow :

D. R. Tullis (3 A.B.C.), error 15s.; W. Colvin (2¾ Diamond-Jap), error 25s.; G. Malcolm (4 Triumph), error 31s.

Keighley M.C.

The first trial organised by this new North Country club was held during the last week-end in August, twenty competitors starting on a stiff course through Pateley Bridge and Grassington. Greenhow Hill was climbed twice, and thirteen riders finished. Full marks were obtained by the following : J. Stansfield (2¾ Douglas), H. E. Philpotts (8 Morgan), G. Shore (3½ P. and M.), E. Emmott (5 Rudge), and W. Scott (3¾ Scott sc.).

Glasgow Western M.C.C.

A members' team trial (teams consisting of three riders selected by lot) was held recently over a thirty-three and a half mile non-stop circuit, which had to be covered twice. The winners proved to be :

A. D. S. Burr (2¾ B. and S.), 32 miles.
G. H. Lennie (2¾ Douglas), 67 miles.
J. Johnston (6 A.J.S. sc.), 67 miles.

The second team, consisting of M. Fraser (8 Enfield sc.), L. C. Hilger (3½ Ariel), and G. Munro (6 A.J.S. sc.), covered 152 miles non-stop against the 166 completed by the winners.

Macclesfield and District M.C.

The last hill-climb organised by the above club was held on Axe Edge, near Buxton, over a measured course of 1,584 yards (nine-tenths of a mile, standing start), with results as follow :

CLASS 1. Members (350 c.c. solo).—1, S. Holland (2¾ A.J.S.), 1m. 40s.; 2, A. Bayley (2¼ Levis), 1m. 49⅘s.; 3, C. J. Hudson (3½ New Scale), 1m. 55⅘s.

CLASS 2. Members (600 c.c. solo).—1, W. Hudson (3 A.B.C.), 1m. 12⅘s.; 2, J. L. Cruickshank (3½ Norton), 1m. 15⅘s.; 3, G. W. Lowe (3½ Norton), 1m. 19⅘s.

CLASS 3. Members (1,000 c.c. solo).—1, J. L. Cruickshank (3½ Norton), 1m. 10⅘s.; 2, F. Bolton (7-9 Indian), 1m. 11⅘s.; 3, W. Hudson (3 A.B.C.), 1m. 12⅘s.

CLASS 4. Members (600 c.c. sidecars).—1, W. M. C. Preston (3½ Sunbeam), 1m. 58⅘s.; 2, J. Dale (4¼ B.S.A.), 1m. 58⅘s.; 3, J. Hopwood (4¼ B.S.A.), 2m. 15⅘s.

CLASS 5. Members (1,000 c.c. sidecars).—1, T. H. Davenport (4 Norton sc.), 1m. 49s.; 2, W. Cumberlidge (6 B.S.A. sc.), 1m. 53⅘s.; 3, J. Dale (4¼ B.S.A. sc.), 1m. 58⅘s.

CLASS 6. Open (600 c.c. solo).—1, T. Simister (3½ Norton), 1m. 6⅘s.; 2, J. L. Cruickshank (3½ Norton), 1m. 10⅘s.; 3, S. A. Crabtree (2¾ A.J.S.), 1m. 10⅘s.

CLASS 7. Open (1,000 c.c. solo).—1, T. Simister (3½ Norton), 1m. 6⅘s.; 2, G. Cowley (3½ Norton), 1m. 7⅘s.; 3, F. Bolton (7-9 Indian), 1m. 8⅘s.

CLASS 8. Open (unlimited sidecars).—1, T. Simister (3½ Norton sc.), 1m. 22⅘s.; 2, G. Cowley (3½ Norton sc.), 1m. 23⅘s.; 3, V. Robinson (8 New Imperial sc.), 1m. 53⅘s.

Special prize for the fastest time of the day presented by T. Simister was won by T. Simister (3½ Norton), who has resigned in favour of the fastest private owner, F. Bolton (7-9 Indian).

Special prize for the best performance of a two-stroke not exceeding 275 c.c. presented by Mr. F. Bayley, was won by A. Bayley (2½ Levis).

Loughborough and District M.C.C.

A reliability trial is to be held on the 19th inst, the chief award being a trophy presented by Messrs. W. and A. Bates, Ltd., of Leicester. Mr. K. S. Topping, hon. sec., 64, Frederick Street, Loughborough, would be glad to hear from any local motor cyclists who would act as marshalls or observers.

Coventry and Warwickshire M.C.

A hill-climb will be held at Stile Kop, near Rugeley, on Saturday next. Nearly one hundred entries have been received, including those of many well-known riders. The start will take place at 2.30 p.m.

Leeds and District M.C.

The results of the hill-climb held at Brogden Hill, Lindley, on August 29th, were as follow :

CLASS 1 (350 c.c. solo).—Cawthorne (Autoglider), 56⅘s.

CLASS 2 (600 c.c. solo).—Backhouse (Triumph), 50⅘s.

CLASS 3 (1,000 c.c. solo).—Cawthorne (Indian), 48⅘s.

CLASS 4 (600 c.c. sidecar).—Backhouse (Triumph), 1m.

CLASS 5 (1,000 c.c. sidecar).—Thornton (Ariel), 1m. 0⅘s.

CLASS 6 (cars).—Stanhope (Stanhope), 59⅘s.

Pembrokeshire A.C.

Although only recently formed, this club had a very satisfactory entry for its first meeting, which took the form of a hill-climb. Machines were timed over a threequarter mile stretch of road, known as Arnold's Hill, between Haverfordwest and Narbeth. The results were as follow :

MOTOR CYCLES OF 350 C.C. OR UNDER.—1, Miss D. Batte (2½ Cedos), 85.2s.; 2, N. V. Robinson (2½ Clyno), 105s.; 3, Miss B. Morris (2¾ Alldays), 90.4s.

MOTOR CYCLES OF 500 C.C. AND UNDER.—1, S. Green (3 A.B.C.), 50.2s.; 2, W. Ludwick (3½ Sunbeam), 50.2s.; 3, W. Roch James (3 Ivy-Precision), 61s.

E. Perkins also rode and passed the post in 47s. on his 3½ Triumph.

MOTOR CYCLES OF OVER 500 C.C.—1, S. Green (3 A.B.C.), 51.8s.; 2, W. Ludwick (3½ Sunbeam), 50.6s.; 3, G. T. Kelway (4 Triumph), 49s. Other competitors were: V. McKenzie (4 Triumph), 46s.; J. R. Thomas (4 Triumph), 56.4s.; E. Perkins (3½ Triumph), 46s.; H. Lewis (8 Zenith), 50.4s.; Capt. Wilson (8 Zenith), 47s.; Capt. Simpson (7-9 Indian), 46.2.

CUP, PRESENTED BY MESSRS GREEN'S MOTORS, LTD., FOR BEST PERFORMANCE OF CYCLES ON FORMULA.—S. Green.

CUP, PRESENTED BY SIR W H. WALTERS, FOR FASTEST TIME OF THE DAY (CYCLES).—McKenzie and Perkins tied with 46s. each, but in the ride off Perkins, whose machine was not doing well the first time, easily won, with 42s. against 46.4s.

MOTOR CYCLES AND SIDECARS (ANY CAPACITY).—1, R. T. Batte (3½ Sunbeam), 87.2s.; 2, King (6 Enfield), 71s.; 3, Capt. Cardew (10 Morgan), 81.6s.

A race meeting will be held on Pendine Sands in about two weeks' time. Full particulars may be obtained from the hon. secretary, Mr. W. L. S. Ludwick, 10, High Street, Haverfordwest.

Club News.—

Fleet and District M.C.C.

A hill-climb was successfully held at the end of August, and some good performances were made. Fastest time of the day was accomplished by M. Chawner, riding a 3½ h.p. Sunbeam. In the 550 c.c. class, S. Julian skidded, and, losing control of the machine, fell and sustained slight concussion; he is not seriously injured, however. The winners of the various classes are as follow :

275 c.c. (solo), W. Julian (2¼ Cedos); 350 c.c. (solo), A. Love (2¾ Douglas); 550 c.c. (solo), M. Chawner (3½ Sunbeam); 1,000 c.c. (solo), M. Chawner (3½ Sunbeam); sidecars (unlimited), W. Julian (4 Norton sc.)

Kidderminster and Redditch M.C.C.'s.

Organised by the Kidderminster M.C.C., a series of speed trials took place recently in the grounds of Lea Castle, Wolverley, Kidderminster, by kind permission of Mr. G. M. Brown-Westhead. Fine weather favoured the large entry. The following are the final results :

CLASS II. UP TO 350 C.C. ON TIME.—1, L. Hanks (2¾ Enfield), 26s.; 2, H. Morris (2¾ Viper), 29s.; 3, G. Carter (2¾ Viper), 32⅗s.

CLASS III. UP TO 600 C.C. ON TIME.—1, H. Poole (4¼ B.S.A.), 22s.; 2, N. E. Smith (3½ Norton), 22⅕s.; 3, C. Brown (4 Triumph), 23⅘s.

CLASS IV. SOLO (UNLIMITED) ON TIME.—1, N. E. Smith (3½ Norton), 22s.; 2, C. Brown (4 Triumph), 22⅘s.; 3, F. W. Giles (6 A.J.S.) and H. Poole (4 B.S.A.) 22⅘s.

CLASS V. SIDECARS ON TIME UP TO 600 C.C.—1, C. Brown (4 Triumph), 26½s.; 2, — Gibbs (4 B.S.A.), 28½s.; 3, C. Rhodes (3½ Sunbeam), 31⅘s.

CLASS VI. SIDECARS (UNLIMITED) ON FORMULA.—1, F. W. Giles (6 A.J.S.), 27s.; 2, — Gibbs (4 B.S.A.), 28⅕s.; 3, C. Rhodes (3½ Sunbeam), 32s.

Fastest time of the day was made by N. E. Smith (3½ Norton), after he had previously tied with H. Poole (4¼ B.S.A.) in 22s., his new time being 21⅕s. The record for the course is still held by the Kidderminster club, the captain, Mr. J. E. Nickson, doing it in 19⅖s. in 1914.

Southport A.C.

Six thousand spectators were attracted to view the speed trials which took place over a one-mile course on the foreshore at Southport on August 28th. There were 139 entries, and the event was carried through expeditiously until a mist from the sea temporarily held up the running off of the car classes. The winners on time were as follow :

CLASS 1 (Scooters).—P. C. Hoyle (2¾ Autoglider), 5m. 28½s.

CLASS 2 (275 c.c. Solo).—W. Ball (2¼ New Hudson), 91½s.

CLASS 3 (300 c.c. Solo).—H. F. Brockbank (2½ Diamond), 80s.

CLASS 4 (350 c.c. Solo).—S. Marks (2¾ Douglas), 66⅘s.

CLASS 5 (500 c.c. Solo).—V. Horsman (3½ Norton), 57⅘s.

CLASS 6 (600 c.c. Solo).—V. Horsman (3½ Norton), 58⅘s.

CLASS 7 (750 c.c. Solo).—V. Horsman (3½ Norton), 58⅘s.

CLASS 8 (Unlimited Solo).—V. Horsman (3½ Norton), 56⅕s. (fastest time of day).

CLASS 9 (600 c.c. Sidecars).—G. E. Cowley, junr. (3½ Norton sc.), 75⅕s.

CLASS 10 (Sidecars Unlimited).—G. E. Cowley, junr. (3½ Norton sc.), 72s.

The Bristol Sports Club.

The Bristol Sports Club has arranged a one-day reliability run to take place on September 19th for the Club Challenge Vase and gold medals. A record entry is expected. Full particulars and entry forms may be obtained from Mr. Percy Gibbs, Bristol Sports Club, Eastville, Bristol.

Brighton and Hove M.C.C.

The newly-formed B.H.M.C.C. recently held an interesting and well attended run. The members were split up into two parties. The sporting fraternity ran out to Barcombe Mills, being timed over a measured distance, the prizewinner being H. Hampton (6 Zenith), C. Volk (3 A.B.C.) being second.

The second party ran out at an easy pace to Ditchling Common, where they were met by the first party, and some interesting competitions were run off.

The "bun-biting" competition was productive of much mirth; only one competitor (Mrs. Volk) was successful.

The secretary, Mr. W. Hawker, 54, Lorna Road, Hove, will be pleased to hear from any intending members.

The Liège-Paris-Liège Trial.

British Machines win the Majority of Classes in French Event.

THE results of the Liége-Paris-Liège trial have now been announced by the Royal Liège Motocycle Club. Marks were lost as follows : For being late at the controls of Dinant, Mezières, Rethel, Reims, Château-Thierry, Joinville, Meaux, Soissons, Rethel, Bouillon, Laroche, Liège, one mark a minute. Competitors arriving at a control after it had been closed lost sixty marks. So far as hill-climbs and speed trials were concerned one mark was deducted for every fraction of 500 metres below the set speed, while marks were also lost for failure to start from cold.

In the classification given below, competitors' names against which there is no loss of marks are those who did not take part in the speed trials or who arrived after the official closing of the Liège control.

Motor cycles up to 250 c.c.: 1, Debroog (James), 1 mark; 2, Nebel (Triumph), 7 marks.

Motor cycles up to 350 c.c.: 1, Feyen, jun. (Ivy); 2, Laguesse (Gillet), 1 mark; 3, Serneus (Gillet), 169 marks; 4, Reinartz (Gillet), 349 marks.

Motor cycles up to 500 c.c.: 1, Desterbecq (Rudge Multi); 2, Ferdy (Rudge, 2 marks; 3, Scorneaux (Rudge), 11 marks; 4, Dachaineux (Frera), 357 marks; 5, Lambrecht (Saroléa).

Motor cycles up to 750 c.c.: 1, Charley (Saroléa); 2, Dehaybe (Saroléa); 3, Melotte (Saroléa), 3 marks; 4, Dewandre (Saroléa), 10 marks; 5, Vierney (Harley-Davidson), 16 marks; 6, Pirard (Triumph), 17 marks; 7, Aimé (Saroléa), 23 marks; 8, Leclercq, Alphonse (Saroléa), 25 marks; 9, Leclercq, Arthur (Saroléa), 26 marks; 10, Thezera (Indian), 32 marks; 11, Brown (James), 44 marks; 12, Verlaine (Saroléa) 63 marks; 13, Polet (Saroléa), 72 marks; 14, Tilon (Saroléa), 73 marks; 15, Gilson (Indian), 104 marks; 16, Gerard (F.N.), 195 marks; 17, Halleux (F.N.), 200 mark; 18, Gina (F.N.), 241 marks; 19, Servais (Saroléa), 478 marks; 20, Thomas (Saroléa), 522 marks; 21, Olivier (Saroléa), 524 marks; 22, Bernard (Saroléa).

Charley and Dehaybe having both finished without loss of marks it was decided to take into account their consistency up hill and on the level in order to differentiate between them. Charley had a difference of 8 kil. 373 metres against 9 kil. 430 metres by Dehaybe.

Motor cycles up to 1,000 c.c.: 1, Porta (Harley-Davidson), 2, Biront (American X), 24 marks; 3, Duchateau (Harley-Davidson), 24 marks; 4, Erodue (American X), 315 marks; 5, Dewael (Harley-Davidson), 319 marks.

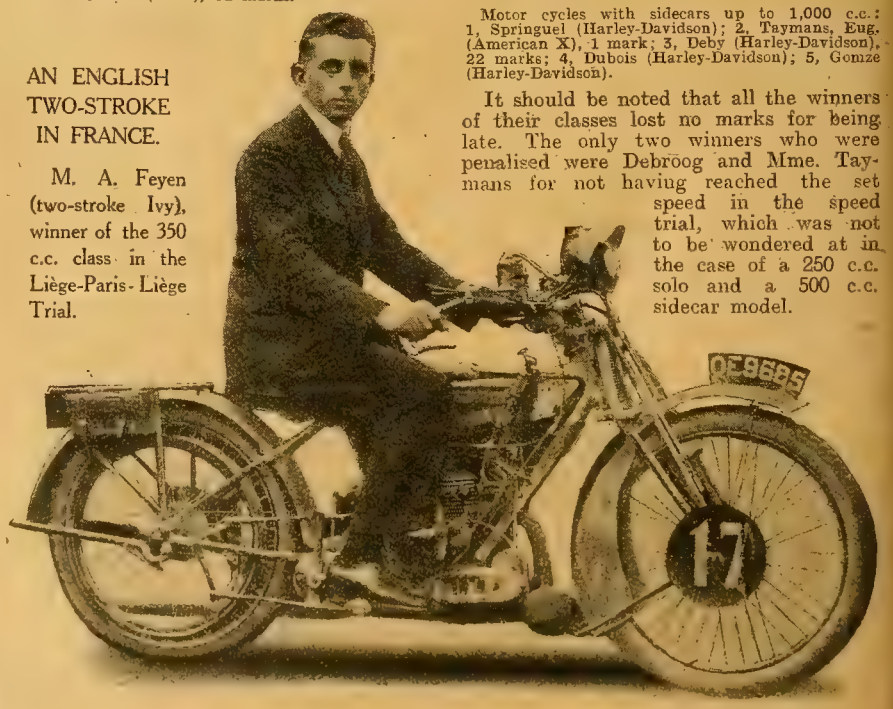
Motor cycles and sidecars up to 500 c.c.: 1, Mme. Taymans (Ariel), 32 marks.

Motor cycles and sidecars up to 750 c.c.: 1, Milhoux, J. (G.L.); 2, Claessens (Saroléa); 3, Taymans, J. (Triumph), 7 marks; 4, Hanley (F.N.), 34 marks.

Milhoux and Claessens were equal, but the differentiation was made between them according to their consistency up hill and on the level. Milhoux had 3 kil. 546 metres against 4 kil. 825 metres by Claessens.

Motor cycles with sidecars up to 1,000 c.c.: 1, Springuel (Harley-Davidson); 2, Taymans, Eug. (American X), 1 mark; 3, Deby (Harley-Davidson), 22 marks; 4, Dubois (Harley-Davidson); 5, Gomze (Harley-Davidson).

It should be noted that all the winners of their classes lost no marks for being late. The only two winners who were penalised were Debroog and Mme. Taymans for not having reached the set speed in the speed trial, which was not to be wondered at in the case of a 250 c.c. solo and a 500 c.c. sidecar model.



AN ENGLISH TWO-STROKE IN FRANCE.

M. A. Feyen (two-stroke Ivy), winner of the 350 c.c. class in the Liège-Paris-Liège Trial.

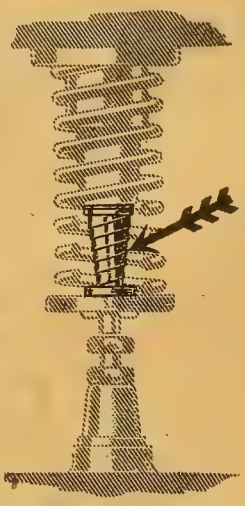
"FLEXEKAS"

Parent Applied for Regd.

Dear Sir—I fitted a pair of your "Flexekas" Air Leak Preventers and was very gratified at the excellent results obtained from these. They certainly do all you claim for them, not only is one able to obtain very slow running, but they also keep the inlet valve stem well lubricated. I have since recommended these to several of my friends and some have machines of very doubtful date with consequently worn inlet guides, and I must say they all without exception speak very highly of your excellent little fitment.

Wishing you every success,
Yours faithfully,
STANLEY M. GREENING.



An airtight flexible spring casing enclosing the valve stem and filled with special heat-proof graphite paste.

2/6
EACH.

Delivery from Stock.

State make and year of machine.

ECONOMY, EASY STARTING & SLOW RUNNING.

Stops air leak absolutely and permanently. Lubricates a vital spot.

Has a remarkable effect in quietening noisy valve gear. No packing used. Nothing to wear out. Refill with "Flexekas" Paste (carton 1s. 6d.) when you overhaul—this is all the attention necessary.

Obtainable through Garages or direct from the Patentee & Sole Manufacturer;

CONSTANTLY

you search for the best market, and for the best value.

In a sense you are an Explorer, and an Explorer takes risks—often he risks his life.

You,

in deciding which agent you will do business with,

Risk not only the making of money—or losing it, but you do also risk your life.

The purchase of a doubtful machine means all this,

As most of you know.

But, as many men realise beyond fear of contradiction,

There is no chance of loss or danger

If you trade with

THE LAYTON GARAGES,

Because at Bicester

Goodwill is valued before all things,

And that was always the case.

That is why there is not the equal of The Layton Garages in any town the size of Bicester in England.

The secret of our success is that we live in the hearts of our friends.

Truly—too—as our friends know, they live in our hearts and lives daily, whether they are here in person or not.

And to the Legion of our friends which increases daily

We tender our warmest greetings, repeat our thanks for past kindnesses, and promise the continuance of Loyal Service

And safe guidance.

If your voyage of discovery leads you to Bicester,

Friendship, and all it means, awaits you.

And, of course, to win your friendship, the right stocks at the right prices must be available at Bicester.

Actually, many men would almost run here barefoot if they knew the possibilities that exist.

We extend an invitation to you to come to Bicester

Personally, if possible, otherwise by postcard.

But do you realise that, by whichever means you approach us, we will, in real truth, treat you as a friend.

And always the Best Stocks and Best Values are at Bicester.

THE Layton Garages

YOU CAN STICK

a pair of Ustikon Soles to your shoes as easy as you can stick a stamp on your letters. No tools are required, neither screws nor rivets. The method is simplicity itself. What can be easier?

These soles are worn habitually by *men*, *women*, and *children* all over the country.

This quick, wide demand for a new product can be explained only by the tremendous *need* for it. These soles resist slipping, thus making walking safe. They are flexible and easy to the feet of men and women, and permit proper growth to younger feet.

Surely in these days of high prices Ustikon Soles are worth consideration. You save money on every shoe so repaired, and get double the wear at half the cost. Once you have fitted you will readily appreciate the economy.

DAVIS'

Trials and their Effects.

THERE has been considerable discussion of late as to whether present day trials are developing the type of motor cycle required by the buying public. This is a subject which requires serious consideration, for as soon as this object is lost to view, a reliability trial, however well organised, becomes merely an empty show or a sporting event without serious intent to improve machines in any way.

It is an undoubted fact that the inclusion of freak hills and surfaces tends to develop a heavy under geared machine, and thus we frequently find motor cycles, primarily designed for passenger work, entered as solo mounts in important trials. This is defeating the object of the event, and though it may produce a suitable machine for heavy solo work in countries where roads are bad or do not exist, we must not lose sight of the fact that the greatest market is in our own country where roads are comparatively good.

Therefore there is but little necessity for the low gear ratios which have come to be fitted as standard. The solo rider of a motor cycle of 3½ h.p. or over scarcely ever uses the lowest ratio of his three-speed gear box, and is consequently paying for something he does not require, and is carrying about unnecessary weight and complication. In this connection it is curious to note that most machines of 3½ h.p. and over are fitted with three-speed gears, while the smaller fry are content with two ratios only. From the solo rider's standpoint this is obviously a reversal of what is required, and points to the fact that the sidecar is having an undue influence on his favourite type of mount. On the other hand, the man who uses a moderately powered sidecar outfit derives little benefit from modern trials, since most of the machines in which he would be interested are ridden solo.

A contributor has suggested that certain features in big trials should be reserved for certain types only, and the idea is at least worth consideration. The question, too, of petrol consumption might well be considered. In fact, at the present juncture petrol consumption in relation to weight and horse-power is the most vital point for designers to consider.

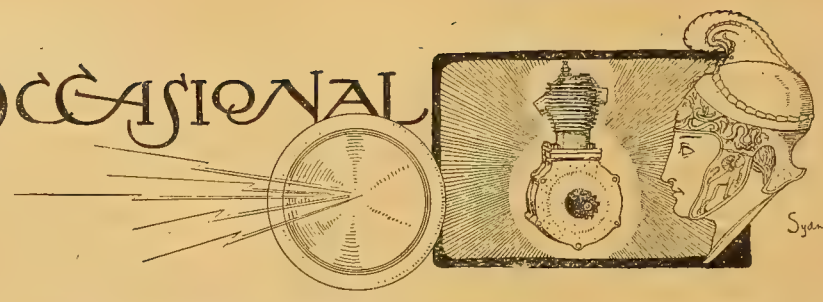
The State of the Trade.

JUST as one swallow does not make a summer so one frost does not make a winter, though there are pessimists abroad who may give it that interpretation. The voluntary winding up of the Sopwith Aviation Co., Ltd., following upon the liquidation of the Clyno Engineering Co., Ltd., is regarded ominously by certain sections of the Daily Press who take it as an indication that the motor trade is stagnant. Such a statement is apt to be misleading, since enquiries addressed to most of the well-known manufacturers show that order books are almost as full as ever. Some amount of stagnation there may be, but trade is not lacking.

Clearly there is always a slight falling off in orders at this time of the year, since fine weather motor cyclists have already purchased their mounts and others are awaiting the forthcoming Olympia Show before definitely placing their orders. Many manufacturers also have been hedged about with serious difficulties since the Armistice. Some of them laid out optimistic programmes for production in large quantities, and installed expensive plant for the purpose, but were subsequently handicapped by rising prices of materials and labour troubles. It has been difficult, also, to obtain the necessary material for the projected programmes, for labour has not exhibited energy since the war, and many other minor causes have contributed to rendering the lot of the manufacturer difficult. The result is in some cases that available capital has been expended before output has been brought to a level that will enable deliveries to be made in numbers sufficient to relieve the situation. This position, happily, is not general.

An index to the advertisements in this issue will be found on the page facing the back cover.

OCCASIONAL COMMENTS



By "IXION"

Metal Seam for Leggings.

NOT long ago I drew the attention of motor cycling tailors to the possibilities of a patent metallic seam for leggings. I have since been informed that the seam was originally invented by a Parisian dressmaker for the benefit of chic demoiselles who wished to wear umpteen frocks per day. It served this purpose well, but when applied to motor cycling leggings by an English tailor in 1910, the metal used to rust, and the unfortunate rider had to be debagged with the aid of a tin opener. Having already plenty of personal enemies, I hereby retract my previous advice.

Service Depots.

I HAVE been spending a few days' vacation with a rider who lives 250 miles from the factory where his machine originates, and is compelled to rail his 'bus that distance whenever it requires any major attention. The freight charges in such a case amount to nearly £2 10s., and, worse still, the machine is liable to damage *en route*. I remember reading that the Ford people, when they decided to attack the market in Morocco and Algiers, transported their local agents to the Ford factory for a fourteen days' "school," as we used to call it in the Army. I do not suggest that the smaller provincial agents could leave their businesses in charge of their wives whilst they went to Coventry for a thorough training in the repair and adjustment of the machines which they intend to sell. But I do say it is absurd that a rider living at Carlisle or Penzance should have to forward his machine (or a big component of it) to Coventry, or Wolverhampton, or Bristol, or London, when it needs really skilled attention. As the reconstruction of the motor cycle industry proceeds, the aim of the trade will doubtless be to establish service depots so distributed that no home buyer is more than 100 miles distant from a depot. At such depots a full supply of spares will be carried, and a staff of mechanics familiar with the machine will be maintained.

Car Type Tyre Valves.

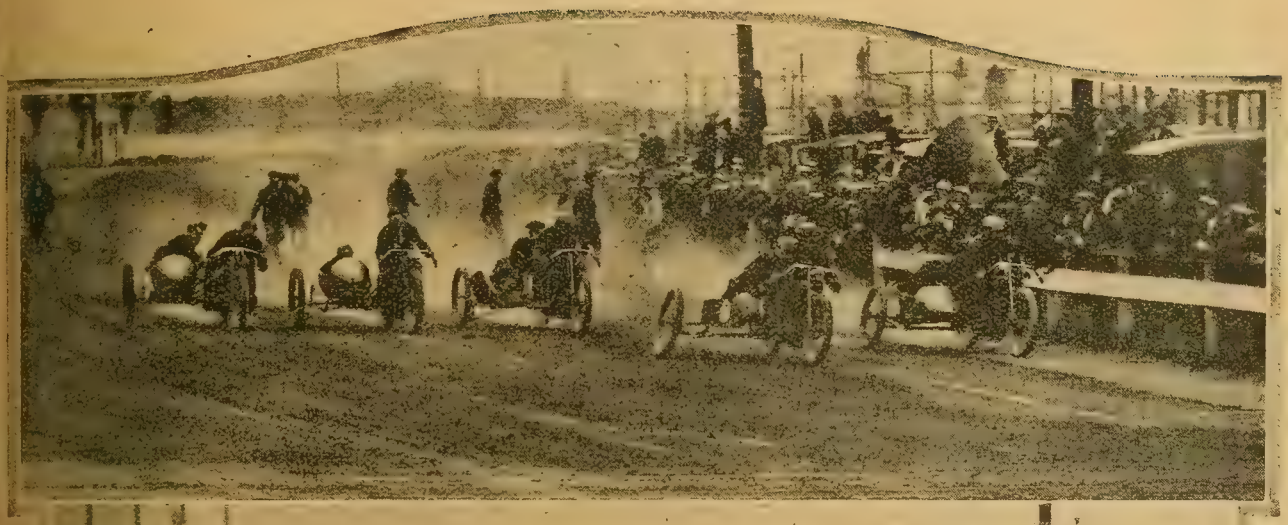
I WISH to become something of a public benefactor by warning innocent purchasers of cycle cars that the car type of tyre valve, commonly fitted to large inner tubes, wants a bit of knowing. It is an old heresy of mine that the invention of a better tyre valve is long overdue; but let that pass. Anyhow, Jones bought his first four-wheeled projectile, and all went well till he noticed in the book of the words that tyres should be kept inflated to a given pressure. He whipped off the valve covers and applied a pressure gauge. All well. Jones went to bed, dreaming of the morrow's run. The sun was shining when Jones arose at six a.m. on Saturday and hied him garagewards. Both back tyres flat. He feverishly searched the treads of both covers, but found no puncturesome objects embedded therein. However, off came the covers, whilst Mrs. Jones hung timidly round with a washbasin full of water. The leakage was presently traced to the valves. Having no spare valve bits Jones was about to postpone the gleeful drive, when an ex-M.T. happened along. In five minutes both tyres were board hard.

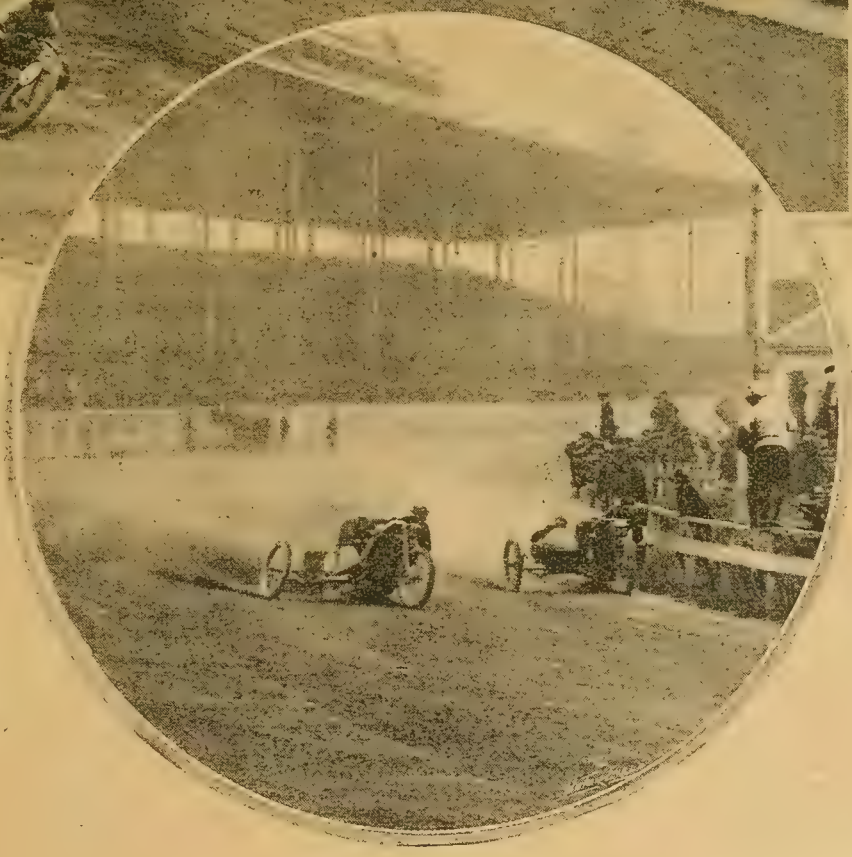
The Morals.

NO. 1 is an ancient moral, and amounts to no more than putting a tyre valve at 12 o'clock, and immersing it in a tumbler or a test tube of water according to its girth. This simple precaution will often prevent the dismounting of a cover where no nail can be seen. Moral No. 2 is familiar to car owners, but not to those who meet car type tyre valves for the first time. These valves have two pressure seals. The battle zone is in the neighbourhood of a pear-shaped blob of rubber mounted on the end of a metal pin; this replaces the rubber tube found in motor cycle valves. The pear generally leaks, but seldom leaks at all fast. Its petty leakages are staunched by a rubber washer inside the small helmet cap on the top of the valve. Jones had unscrewed these caps to test his pressures, and had omitted to tighten them home again properly. Hence the petty leakage past the pear had let his tyres down during the night. There are other points at which such valves may leak, but I spare you. Perhaps it is worth adding that the pear generally leaks furiously when there are only a few pounds of pressure in the tube, *e.g.*, in the course of investigation or re-fitting; but that it generally beds down to its work pretty decently when working pressure is approached. Some riders do not know that garages stock small packets of replacement parts for these valves, of which a supply should always be carried.

The Conscientious Agent.

SAILORS hold that there is a little cherub who sits up aloft and watches over poor Jack. I know a motor cycle agent whose theology is of a more cynical type. Anxious to oblige a hungry customer, he paid another agent something near full retail price for a 'bus which is in great demand; and fearful of the M.T.A. he disposed of his purchase at list price. In order that his client should meet no trouble, he carried out a road test of the machine prior to delivery, seeing that in factory tune it did not start too easily. In his three mile tuning spin the back tyre picked up an enormous rusty staple, which perforated both tube and cover in two places. By the time he had fitted a brand new tyre, as in duty bound, his meagre profit had evanesced. This agent is now poring over the book of Job.





TRACK RACING IN CANADA.

These striking photographs, taken in Toronto, convey a good idea of the public interest in motor cycle racing in Canada, the lower picture depicting a big grandstand packed with spectators. That the actual racing can be seen in progress all round these small dirt tracks no doubt accounts in some degree for the amount of public support shown. Sensational finishes on such tracks are certainly more frequent than they are on the great course at Brooklands.

Drifting clouds on the flanks of Ben Lomond; a scene on the twenty mile stretch of loch-side road

A Tour in the Highlands

A Lonely Tour of Twelve Hundred Miles from the Midlands to Scotland with a Two-stroke Sidecar Outfit, described by "Wharfedale."

MY weekly duties entail the observation of innumerable reliability trials and the like, which involve me in much hard riding.

In consequence I might have conscientiously decided to take my holidays in peace, away from motors and motoring, but my 'bus and I are inseparable, and so my vacation had, indeed, to be of the 'busman's variety.

June was the month I selected, and one fine day, I started out from Coventry, heading northwards.

A new aluminium body made to suit my own ideas by the Willowbrook Co., of Leicester, had been hurriedly fitted to the sidecar chassis of my Scott, and it was packed with spares, a heavy photographic outfit, suit cases, and benzole. The engine, having already 6,000 miles to its credit (without decarbonisation!), purred away contentedly, and Kendal was reached in the evening.

The main road *via* Warrington, Wigan, and Preston, was found to be quite good, only a few miles between the last two places remaining to remind one of its former terrors. Kendal was full to overflowing, and having sought shelter at a small inn, an hour was spent chatting over rotary valves and other things with that ardent Scott enthusiast, L. S. Parker. In the morning the switchback road to Bowness, *via* Crook, was taken; much the best way to Windermere from Kendal. The ascent to Kirkstone provided some hard low-gear work, but the descent to Patterdale was taken fast with an idle engine. Ullswater looked well in the morning sunlight, and the Lake District was a temptation to dally. However, Loch Lomond was the objective, far to the north.

From Penrith to Carlisle is a lovely speed road, and much time was gained by keeping a wide throttle. North of Carlisle one does not realise that Scotland has been reached until the word "Ecclefechan" (in large "caps" on an A.A. plaque) smites the eye; of course I at once commenced to practise the guttural "ch"

A Tour in the Highlands.—

Through Beattock the scenery improves, and over the moors towards Abington the winding of road and railway is interesting. Shortly after leaving the latter place a small shock-absorbing spring beneath the sidecar body collapsed, and not having a spare it was replaced with a bundle of sacking secured with string. Towards Hamilton the surface deteriorated, and into Glasgow became indescribably bad. Arriving in the capital an S.O.S. to the works for more sidecar springs was despatched. No time was lost in getting on, and Balloch was reached at nine in the evening; overwhelming hospitality was found at the Balloch Hotel.

Morning broke dull and grey, and after breakfast I found my engine sulky, only to discover that the magneto chain spring clip had dropped off, thus allowing the chain to become detached. Once traced the trouble was immediately righted, and a glorious run of twenty-five miles beside Loch Lomond soothed my ruffled feelings. The low banks of cloud on the shoulders of Ben Lomond added to the charm of the scenery. From Ardlui to Crianlarich the road increases in roughness, but is nowhere bad. Crianlarich comes rather as a surprise, its excellent hotel, the village shop, and the many new villas appearing incongruous in such a barren setting; the road towards Killin, after leaving the dark and silent Loch Dochart was excellent, and the gentle ascent over to Glen Ogle was taken famously "on top."

To be Envied.

On the descent, through charming scenery, to Lochearnhead, I noticed, with considerable envy, a 3 ton lorry converted into a splendid caravan—a truly delightful habitation for the summer months. The run through Crieff to Perth was devoid of incident, but the roads in Perthshire are almost universally bad, and though a warm welcome awaited me I only spent two days in the "smallest city in the world," what time my spare sidecar springs arrived.

Heading further northwards I took the main Highland road over the Grampians, *via* the Pass of Killiecrankie, whereafter my luck, as regards weather, ran out, for over the mountains I encountered blinding rain, which lasted until long after I had received an excellent cold lunch late in the afternoon at Loch Ericht. By Kingussie, however, the sun came out again, and I was favoured all the way to Inverness. Tempted by the fine evening, I carried on towards Dingwall, but the pot-holes were trying, and as the skies threatened I decided to stay at Muir of Ord. Rain fell all the night, and I delayed my start until ten in the morning, then on through Dingwall and Strathpeffer, with its magnificent hotel and pretty little shops, to Garve. Here the road deteriorates, and in the north-westerly direction, aiming for Dundonnel, it becomes a mere track, in many places raised on a high banking. At one of these spots a motor-mail van of antiquated vintage juggernauted me off the road, and my sidecar wheel slipped off the banking, and only the chassis saved me from dropping entirely on to the moor. I was now on an old, six days route, and although the hills are of no account the surface was decidedly rough and loose in places.

This part of the country is terribly lonely, no villages are touched at all, and Dundonnel only consists of an hotel and a few scattered cottages two or three miles away. Alongside Loch Droma I disturbed a finely antlered stag drinking at the waterside.

The Dundonnel Hotel, lonely and windswept as it is, provides a real traveller's meal, and much refreshed, I pressed on into the strong sea breeze coming up Little Loch Broom.

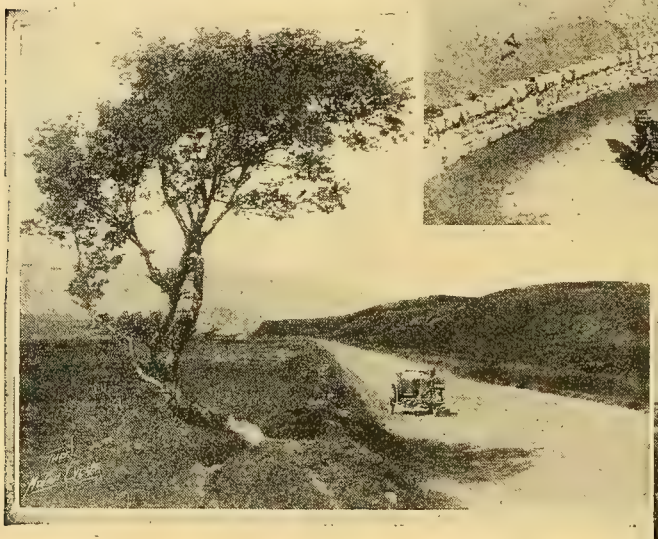
I cannot do justice to the beauty of that wild coast, but Gruinard Bay, Poolewe and Gairloch will stay long in my memory. At the first named the road hangs on the face of the cliffs in quite an appalling way, and the gradient was the first I had encountered to demand the low gear.

Turning inland I found Slioch with his head in the clouds behind Loch Maree, and early in the evening dropped down the hills into Achnasheen, where in this seeming desolation, I found the hotel proprietor busily installing a petrol storage tank and delivery pump!

Loch Maree, claimed by many as the most beautiful loch in Scotland, and beyond dispute a fisherman's paradise.

A Tour in the Highlands.—

Achnasheen has a reputation for rain to which it did not fail to live up, and I left it in the morning in a steady downpour, which lifted as Garve was neared and ceased altogether as I entered Strathpeffer again. From Muir of Ord I turned due south through Beauly and struck Loch Ness and Drumnadrochit; I nearly did this literally, as my brake refused to hold on the descent of a very steep hill down which was indicated by a stone-



SCENES OF MOUNTAIN, LOCH, AND SEA.

(Top) At Gruinard Bay the road hangs on the cliff face, with a sheer drop to the sea behind the wall.

(Left) On the southern border of Inverness-shire, the main north road looking towards Kingussie.

(Right) Wild scenery is the order on the western coastline of Ross and Cromarty. The terrible road surface near Poolewe (on Loch Ewe) tried the Scott frame and chassis to the utmost.

breaker. For some yards the machine was quite out of hand, and only by cutting out the ignition and engaging the low gear against the stationary engine was the machine stopped.

Lumber Camps.

All the way down the Caledonian Canal the roads are cut up by timber hauling, indeed, the extent of the wood-cutting activity and the hutments of the lumbermen give a very Canadian aspect to the scenery. The road on the southern bank of Loch Oich is frightfully loose, being cut through by the floods which bring down tons of débris from the mountain sides.

Hereabouts, I encountered numbers of encampments of "tinkers," those gipsy-like people who are said to have wandered the Highlands homelessly since the massacre of Glencoe. Whether this is so or not, it seemed that their picturesque appearance was best studied at a distance and to windward!

Despite pot-holes near Fort William, the road was excellent as far as North Ballachulish, where I peacefully stayed the night, having watched a motor car taken across the well-known ferry, and decided that I would best do the crossing in the morning.

Before retiring heavy rain commenced to fall, and it continued all night, as I have reason to know, since I paraded my bedroom floor without ceasing, being racked with neuralgia.

At nine o'clock in the morning I trundled down to the pier, and noticed with consternation that the motor-ferry, safely moored the previous night, had disappeared. Rain fell without ceasing, and I passed a dismal hour and a half, watching the boat beat its way up the Loch against a strong tide. Having paid five shillings for the favour, I was duly deposited at the other side of that little neck of water, which is just too wide (and much too deep) to ford, and I proceeded with all speed towards Glencoe.

A Woeful Pass.

The cross-head refers more to my own state than to any historical associations connected with the famous defile which I now entered, but I lost interest in the scenery—my face ached, my chain came off twice owing to tremendous skids and swerves in the loose and shingly surface, and two more sidecar springs broke. From the top of Glencoe the road increased in roughness, and feeling very tired I appreciated to the full the thoughtfulness of whoever placed the Iveroran Hotel in the midst of the wilderness. Here I lunched, at the usual reasonable charge, with an enthusiast who was pedal-cycling in the opposite direction—it was a relief to find that I was not the only one taking my pleasure sadly.

(To be concluded.)

ROAD TESTS OF NEW MODELS

Sidecarring with a Small Two-stroke—the 2¾ h.p. Connaught on the Road.

The Possibilities of the Present-day £100 Touring Outfit for Two.

THIS is not a story of terrific gradients and hair-raising speeds, rather is it a tale of an ordinary every-day tour, such as anyone might undertake at a moment's notice, and without undue preparation.

There is, however, a point to the yarn, in that two persons with a week's luggage enjoyed a very pleasant tour of 380 miles, stopping where they willed, and visiting many friends and relations, at the total expenditure of fuel and oil of 18s. 8d., a sum which certainly cannot be considered extravagant in these days of expensive railway fares.

But, to begin at the beginning. A short time ago Messrs. The Bordesley Engineering Co., of New Bond Street, Birmingham, offered us one of their new £100 sidecar outfits for an extended trial. As we were due to take a holiday the week following the offer, suitable arrangements were made, and the little 2¾ Connaught, fitted with a two-speed Sturmey-Archer gear box with clutch and kick-starter, duly arrived, towing a coach-built sidecar of no mean proportions. Being enthusiastic as the rider of a fast solo machine, it was with some misgivings that we contemplated the size of the engine (73 × 70 mm. bore and stroke = 293 c.c.) and the load which it would have to carry.

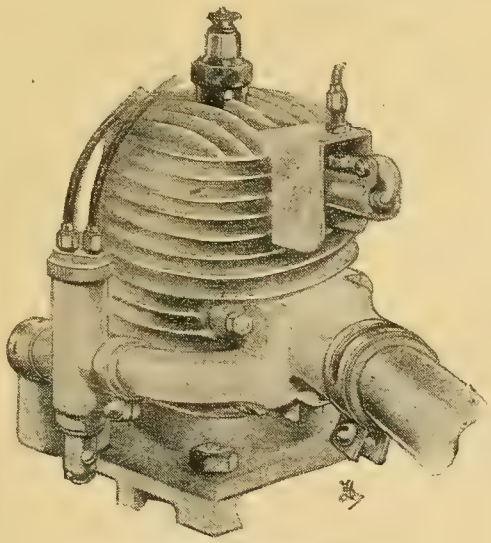
However, having summoned up the necessary courage, the engine was started, and in the six miles run home it became very apparent that the Connaught was no joke, but a serious touring proposition, and developed a power output quite surprising for so small an engine. On the following morning, having carefully bestowed a wife and various packages in the sidecar, and two large parcels on the carrier, the serious business began, and we set out with the light heart and heavy load that betokens the first day of a motor cyclist's holiday. The run from Kenilworth to a spot not very far from St. Albans was accomplished at an average running speed of just under nineteen miles per hour, and after a little practice it was found that the machine pulled well down to the last gasp, with the exception of Braunston all the London road hills being taken on top gear (5¾—1). It is quite possible that the long slope from Braunston village could also have been climbed on top gear, but the rider had not become quite accustomed to the wonderful slow pulling, and changed down unnecessarily early.

There followed a series of trips to Tring, to London, and to Shepperton, thence to Ascot to visit more friends, and then to Shillingford for a couple of days on the river, and finally a run home *via* Oxford, Banbury, and Stratford-on-Avon. On returning to the starting point, the mileage worked out at 380, and the petrol consumption at just over four gallons, or well over 90 m.p.g. On this trip, it is true, no really severe hills were encountered, but the routes were never altered to avoid hills, and such as were met with were climbed with ease. This with an engine of under 300 c.c., gear ratios of 5¾ and 10½ to 1, and a total load of 700 lb.

A Smooth-running Engine.

And now to details and criticisms. The running of the engine was smooth and steady throughout, and the mechanical troubles were covered by a change from an unsuitable plug to a more suitable type and one shortening of the belt.

The engine "four-stroked" extremely little, and this probably is partly accounted for by the combined inlet and exhaust manifold, which warms up the mixture before reaching the crank case.



Combined inlet and exhaust manifold of the Connaught engine.

Petroil lubrication is used, and functioned admirably throughout. The advantage of a foolproof lubrication, combined with an automatic increase of oil supply to the engine governed by the throttle opening, easily outweighs the slight messiness inherent in the system. On the machine supplied to us no cover was arranged for the driving chain, but this omission has since been rectified on all standard machines by fitting a neat cast aluminium cover plate.

The sidecar springs were rather too stiff, the sidecar mudguard stays erring the other way and

Road Tests of New Models.—

broke; both these troubles, however, have been since tackled and overcome. A slightly lower top gear, say 6 to 1, would be an improvement for sidecar work, especially on heavy roads and against head winds. An average speed of over 20 m.p.h. can be maintained with a loaded sidecar on good roads, but 19 m.p.h. is a more suitable speed for this little outfit. The engine may be driven all out up long hills with no apparent detriment and no signs of drying up, but it is not desirable to attempt to maintain high speeds on the level. At the conclusion of the above-mentioned trip, the outfit was driven for a further fifty miles, including a comfortable ascent of Stoneleigh Hill with an eleven stone passenger. On returning to the works the cylinder was removed for examination, and extremely little carbon deposit was found except in the exhaust ports, which were somewhat choked due to over-lubrication. The top piston ring was slightly gummed up, but all bearings were in perfect condition. Our conclusions are that the $2\frac{3}{4}$ h.p. Connaught and sidecar forms a most sporting and thoroughly reliable little outfit, which will undoubtedly attract a large *clientèle* owing to its low cost and upkeep. H.D.T.

THE SCAR, a hill that was included in the Scott Trial. The photograph conveys a good idea of the scenery, which was little appreciated by the majority of competitors. Most of the enthusiasts were too fully employed negotiating the tortuous course to admire the many fine panoramas. Observe the acute hairpin bend on the right and the ribbon of road in the valley leading up to the hill.

A CONFESSION.

THIS is a story with a moral. During the rainy month (July), I was returning home after a trip South to see my brother and had occasion to remove the carburetter of my machine to clean it. Before I had finished this job, it began to rain, so I put my tools away in a hurry and endeavoured to get a start. Nothing doing! I then took out the plugs and cleaned them; they were a bit oily, but nothing to signify. Again no result! Next I tested the spark and found it excellent, but there was no result in spite of priming the cylinders. Readers may think that I should have attended to all these matters in the first place, but let me hasten to say that nothing seemed to be wrong when I stopped except a scarcity of petrol at the jet; moreover, it was raining, and I was anxious to get away. Now my carburetter is well tucked away under the rather wide tank, and it is fitted with a revolving barrel throttle and a detachable control wire in lieu of the usual type, which passes through the top of the carburetter and raises a plunger throttle. After wasting many minutes in futile attempts to start, I remembered this wire, and a glance showed that it was still unfastened, and I had been trying to start with a well fitting throttle tightly shut. The lever on the handle-bar works so smoothly and easily that this did not reveal the fault. A moment later the wire was in place, and the machine was off, but only to stop suddenly fifty yards or so further on. While the wire was detached, the outer casing had slipped from its socket and the throttle was again shut. This was remedied without any difficulty, and no further trouble was experienced, but I paid for my stupidity later on by encountering more rain.

J.H.W.

The Experiences of a "Motor Cycle" Man in the Six Days.

MY own rough-riding machine began a fit of sulks a week or so before the Six Days, and the manager of a leading factory very kindly came to the rescue with the loan of his own private mount. I took delivery of it in Coventry on the Saturday before the Trials, and it provided a most interesting problem en route to Darlington, for it was guilty of a single terrific misfire once in every 400 yards. The puzzle was solved accidentally, for beyond Newark the engine grew loth to start, and when the magneto rocker arm had been eased, the misfire evaporated. The next disagreeable thing was the frightful bumping received from the record pot-holes between Doncaster and Wetherby—a route to be avoided by every rider who loves his machine. Finally, outside a smithy at Brotherton, the engine became permanently free, and I found that the key of the forward sprocket of the rear chain had sheared. A pushbike spindle was soon heated, flattened, cut off, and filed to size; but by this time a cold rain was falling in torrents, darkness had set in, and the electric lighting set evinced a bad short in the tail lamp wire between the core and the concentric return path. The inns were full, and the police and the elements had to be defied; but finally a little inn at Bramham did me very proud for 8s. 6d.

Good Samaritans.

Sunday saw the ride to Darlington completed without incident, and Monday morning saw me setting out with the boys, rather anxious about the capacity of my machine after the vicissitudes of the week-end. The morning's run showed that I had a magnificent engine under me, for the stiff climb out of Pateley Bridge asked for no more than second gear with the throttle in practically the tick-over position. It was quite clear that bottom gear would take me up any gradient possessed of a steerable surface. After a lightning lunch I left Ilkley just ahead of the first man—local yarns suggested that Park Rash was a hill on which non-competitors should not risk baulking the entrants, and my colleagues astern could bring up the rear. Exactly opposite the smithy at Bolton Abbey the improvised key in my countershaft sprocket sheared, and the prospects of seeing the fun on Park Rash looked black, when D. H. Noble came up on an Overland car, and very handsomely took me along, though he represented a rival interest. At Park Rash the preliminary difficulty was to arrange all the spectators' motors clear of the road, for the approach is merely a farm lane of rutted turf. Presently, what a variety artiste would term the "knockabout business" began, for the men's chances of getting up depended wholly on two factors—whether they knew the hill, and how badly they were baulked. When the wrecks had been swept up and the laggards pushed above the hairpin, the problem of salving my derelict 'bus became imminent. Fortunately Jesse Baker came to the rescue with his Scottish Trials Scott—and a very "hot" Scott at that. He took me back twenty miles on his carrier, and incidentally proved in those crowded, twisting, dust-wreathed lanes how safe pillion riding is in the control of a master; exchanged machines with me; drove off on my newly-keyed single whilst I took his Scott to Darlington.

Some Freak Hills.

On Tuesday my instructions were to start ahead of the boys, and report White Shaw Moss, then reputed the worst ascent of the week, leaving the earlier climbs to the rearguard of the staff. After Reeth the blue trail on the road led me into the comic farm lanes which always suggest breakers ahead, and before long I found my engine inclined to dislike top gear. Presently the track degenerated into a mere trail of stones and earth, zigzagging up through the woods,

Round the Trials.—

with no grippable going to be seen, a precipice skirting one on the left, and boulders which played cup and ball with the front wheel. None of us had heard any fearsome tales about Summer Lodge, and I was as much taken by surprise as the competitors who followed hard on my tracks. As soon as one realised that it spelt lots of throttle on low gear, plus hanging on to the bars by one's eyebrows, the climb was possible with a clear road; but it must have been a horrid experience in the crowd, with baulked passenger machines on all the blind corners. I longed to wait and see the fun, but orders were orders, and I pushed on to White Shaw Moss, which was a much easier lottery of the same kidney, facilitated by a wider road and the fact that the latter hill goes up in steps, so that the landings give the men a chance to sort themselves out. Still, a hill which can make Sam Wright ram a wall is not child's play, is it?

On the Stake.

The afternoon run would have produced a Caporetto if rain had fallen. Thanks to the dry going, bad driving was chiefly responsible for the few failures which occurred. For instance, the "turf hill" (Darnbrook) commences with a grassy hairpin in softish order. Several sidecars "cut" this corner, and so dug their back wheels well in. On the Stake I learnt how not to restart a machine on a soft surface. I stopped halfway up in order to watch a few men, and, when I was ready to complete the climb, I felt bound to leave the better going clear for the boys, and so attempted to restart off grass. As the grade was steep, I gave my willing engine moderate throttle, and she flung me bodily round in a circle while the rear chain jumped its sprocket. I was grateful for the lesson, which came in handy repeatedly during the week. On the run in I debated fiercely with P. W. Bischoff the ethics of withdrawing his Clyno team as a protest against the roads; his baby Clyno will evidently bark along all day on undulating roads at 35 m.p.h.

The Effect of Watersplashes.

Wednesday morning, bereft of Rosedale Abbey Bank after much wobbling on the part of the stewards, was a picnic, and the keen Yorkshiremen were extremely irate about the change of route. The afternoon was more interesting. Boltby was a very fair hill, and the machine which cannot climb it with certainty deserves no pity. I had felt inclined to deprecate the succession of watersplashes included in the route, for they seemed to be unnecessarily hard on the belt, which still has its uses on the lighter types of machine; but when I saw how many magnetos and sparking plugs still go "dud" after a ducking, I changed my mind. I was using porcelain plugs on the Scott, and cracked two of them in deep splashes, whilst quite a lot of magnetos temporarily gave up the ghost. Seeing how many fords figure in overseas riding, it seems desirable that future trials should include plenty of deep splashes; but the penalties should not apply to light belt-drivers not designed for the export market.

Thursday's run was a pleasant tour, containing nothing strenuous except the rather unpleasant and dangerous drive through mining villages in the concluding stage.

Friday brought a machine-smashing morning, followed by a long afternoon tour. The surfaces in the morning was well calculated to complete the fracture of any weak component which had been well stressed by previous bucketings. If any reader wants to break his frame, let him procure a copy of the A.C.U. programme, turn up Friday morning's route, and ride the last twenty miles before lunch. Harden Bank is a veritable machine smasher—a sure climb every time when once you know it, but about the most unpleasant hill in England to tackle at first acquaintance; several first-class riders fell or failed on it, and many more made ascents of a kind which they regarded as personal humiliations. For myself I scrabbled up anyhow. One had to look upward and onward in order to pick out a rideable path, for large patches of the hill would unsaddle anybody; whilst one's eyes were busy path-picking, some great reef or boulder set the machine wobbling, and by the time it was steadied, it was usually yards wide of the less nobbly bit which had been selected from below as the track to make for. Most of us utilised the good going in the afternoon as an opportunity for speed bursts, each of which provided a little subsequent leisure for cleaning up or minor adjustments.

Ideal for the Work.

Saturday morning provided a gentle tour to Brooklands, followed by a rather hot and boring afternoon for the spectators. The universal opinion was that there were no flies on a machine which completed this searching week without serious discredit. I ought to add a word in appreciation of my borrowed Scott. In two special respects it is a specially fine mount for a job of this kind. The first is its simply beautiful steering; no machine is safer to ride or easier to handle on difficult going of any kind. No motor cyclist really enjoys riding over bad grease or deep ruts, or reefs of rock or loose stones; when we have to do it from any kind of compulsion, the perfect steering of a Scott alleviates the task incredibly. Its second special excellence in service of this character is its exceptional comfort. Its spring fork fears comparison with no rival, and the 3in. Palmer cord tyres, blown rather soft, and used in conjunction with a fine saddle, afford as much comfort as is possible under the riding circumstances, and materially reduce the fatigue of a week at speed over vile roads. Baker's engine was timed with the full retard where the full advance should be, but was never short of power on any of the hills, and in five days the only trouble consisted of a couple of plugs sooted up through too generous lubrication, and a couple more cracked in watersplashes.

SIDECAR STEERING.

WHY were some sidecars answering their steering on bad surfaces in the Six Days so much better than others? It was noticed on the freak hills that many outfits had their front wheels set at quite a sharp angle to the line along which the machine was advancing, so that the wheel was really acting as a sort of skid brake, and absorbing much engine power. Others by contrast were really following their front wheels obediently—the Enfields notably so.

Reminiscences of the Scott Trial.

Over boulders and grass tracks. A silhouette of a competitor in the Scott trial.

Whose was the footboard discarded on Dead Man's hill?

By-the-by, what a suitable name. Loose stones and heather roots are bad enough on a 1 in 4 descent, but the addition of cross gulleys, of which there appeared to be hundreds, was the limit.

Manufacturers' teams did not turn up in large numbers, and the P. and M. were one of the few firms to prove that they had sufficient faith in the rough-riding capabilities of their men and machines. This faith was justified by results.

There was much discussion anent Dob Park watersplash, some riders maintaining that no one could guarantee a clean crossing since the boulders shift with every "spate," others were prepared to pack themselves to cross without trouble every time.

Five riders succeeded in accomplishing the set speed of 20 m.p.h.: four Scotts and a Triumph. It is noticeable that all these riders were well acquainted with the course, a point which is of some value in a trial of this description.

OVERHEARD IN BURNSALL.

First Competitor: "Well, 'old bean,' how did you get on?"

Second Competitor: "Often!"

The stretch of bog and moorland after Grimwith reservoir was truly frightful, and many competitors cast longing eyes at the horses ridden by two spectators. At least one offer of a swap was made and declined.

All sporting riders will thank the Scott Company for throwing open to them a trial which was originally organised for Scott employees only.

Bent and missing footrests, broken footboards, squashed silencers, and dented exhaust pipes and rims, were common objects at the finish, while not a few competitors walked with a limp.

One frequently heard the question, "What is the object of such a trial?" Ask the competitors. They did not grumble, and, anyhow, it showed what a man and motor cycle can do!

There were crowds of observers at many of the points of interest, but, unfortunately, from their point of view, some of the tit-bits were inaccessible to the average motor cyclist.

One or two competitors ran out of petrol near Middletongue, and lost valuable time in refilling. Beyond this, and a few tyre troubles, failures were largely confined to optimists who attempted the course with too little power or too high gears.

That some sixty riders finished speaks well for the construction of British machines. The twin two-stroke and the 4 h.p. single easily outnumbered all other types, both as regards entries and finishers. Unfortunately, the big twins, which have a reputation for Overseas work, were unrepresented, and were thus unable to prove their merits to British roughriders.

The following awards are in addition to those mentioned last week.

SET OF PALMER TYRES (presented by Mr. E. Mitchell, London), for best individual performance of any machine of 350 c.c. or under: G. W. Wilkin (Wilkin), 160 marks.

SAPEY PRIZE (set of lamps and horn presented by Mr. A. E. Sapey, Birmingham), for second best trade performance: H. Langman (Scott), 235 marks.

GOLD MEDAL (presented by the Scott staff), for best performance by rider from Scott works, outside prize-winners: A. Holdroyd (Scott), 210 marks.

GOLD MEDAL (presented by W. A. Dovener, secretary of Scott Co. and of the Bradford Motor Cycle Club), for best performance by a member of the Bradford M.C.C. other than above awards: Geoff. Hill (Scott), 218 marks.

GOLD MEDAL (presented by the Scott staff), for fastest time after prize-winners: H. S. Moorhouse (Triumph), 203 marks.

CONSOLATION PRIZE (case of pipes, presented by Mr. E. Cummins): Carl Mitchell (Triumph), 145 marks (before retiring owing to accident).

THE MELLANO CUP was awarded to H. E. Ellis (B.S.A.).

CERTIFICATES OF MERIT will be issued by the Scott Motor Cycle Co., Ltd., to all competitors who completed the course and were checked at all observed points.

£35 8s. was collected for St. Dunstan's Hostel by sale of programmes, etc.

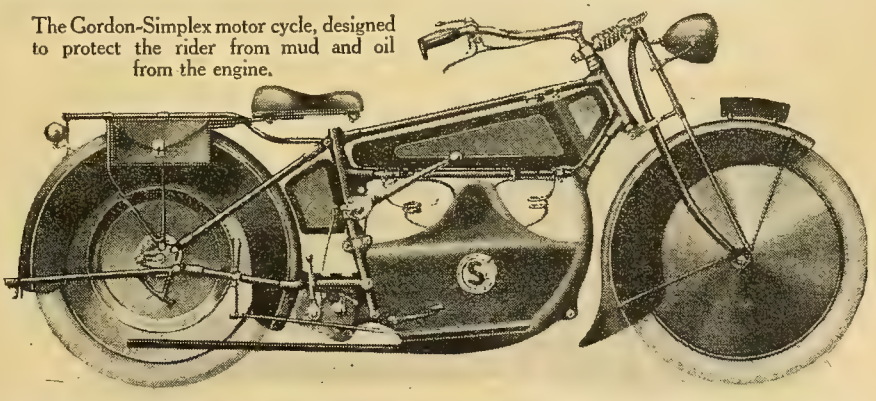
An Enclosed Flat Twin.

Comfort and Cleanliness the First Essentials in the New Gordon-Simplex Design.

A SERIOUS attempt to produce a machine on which the rider is protected from mud and oil from the engine has been made by the Gordon Simplex Engineering Co., of Aylesbury and Bournemouth. To attain this end the engine is enclosed in a cowl which gives to the mount a somewhat heterodox appearance, but without any tendency to freakishness. In addition to the engine cowl, large mudguards, leg guards and disc wheels are fitted which combined make the machine of the "hosable" type so long the ideal of many riders.

The engine is a Coventry Victor flat twin, which is fitted with a Lamplugh mechanical oil pump driven directly from the camshaft, by means of which the engine, gear box and entire transmission are automatically lubricated. Several interesting features are embodied in this machine, with which we hope to deal more fully at a later date. These include a cantilever sprung seat and a theft-preventing device.

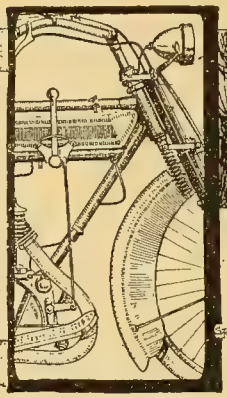
The Gordon-Simplex motor cycle, designed to protect the rider from mud and oil from the engine.



Every effort appears to have been made to give many of those luxuries that have long been desired.

Some Thoughts on Two-strokes.

Concerning Carburation and Ignition.



I PROPOSE in this article to touch lightly upon some aspects of modern two-stroke motor cycle engines, and to plead for the interrelation of Carburation and Ignition control.

The basic problem which renders this difficult is the insistence by the makers of relatively low cost of production, and fear on the part of the general public of anything that savours of complication.

Now, assuming that the present crank case pump type of engine is to be the standard for some time to come, let us consider how overall efficiency can be increased by modification of the existing methods of carburation, lubrication, and ignition. Carburation and ignition are interelated, inasmuch as they govern (1) speed of combustion, and (2) moment of maximum pressure relative to crank pin position. The faster the crank pin is passing the top dead centre, the quicker and earlier we may allow these two to take place, resulting in higher speed. This brings us to a few considerations upon

Ignition.

A weak mixture fires quicker than a strong one, so, therefore, we may consider that advancing the spark or weakening the mixture have the same effect. Now, the mixture upon which a two-stroke runs has to be on the rich side, as, owing to the heavy dilution with spent gases, only a comparatively small volume of fresh fireable gas is compressed at the end of the stroke. This mixture is slow burning, and we can, therefore, set the point of ignition far earlier than with a four-stroke.

I submit that the arc of advance and retard on present-day magnetos is too small for two-strokes. It is sufficient for fours; but it should be realised that it has only half the effectiveness upon a two. Assuming that the arc of advance and retard is 15°, this means that it is possible upon a four to cause the spark to occur at any predetermined point over 30° of the crank pin movement, the crank pin travelling at twice the speed of the armature, but on a two-stroke where the armature and crank pin speeds are equal only the 15° are available. Thus we see that, although a wider range of advance and retard is urgently called for, the very fact that the magneto is run at engine speed actually reduces this arc. A makeshift way out of the difficulty would be to run an 180° magneto at half engine speed, using each spark alternately. A truer solution will be found, I think, in the development of types of magnetos, such as the Mea, on which the field rotates with the contact breaker cams causing the points always to break when the armature cuts the maximum lines of force, or polar inductors such as the Dixie, or an adaptation of the Ford system, on all of which a far wider range of advance and retard is possible (I believe there is nothing to stop it going all round the clock on all three). The logical sequence would then be the inter-connection of the throttle and spark control with some spring controlled device which it would be necessary to hold out during the time one desired to retard the spark for a hill when full throttle was necessary, otherwise let spark advance follow throttle opening. It would then be possible to use firing points of 12 mm. to 16 mm. before top dead centre at from 35 to 45 m.p.h., with the certainty of coming back to 5 to 7 mm. for slow running and traffic work. Acceleration would also be found to be vastly improved.

Carburation.

As will be seen from the foregoing, ignition presents some pretty problems to the designers of the future, but, compared to those which arise when the problem of carburation is even casually examined, its state may be considered nearly perfect. In endeavouring to deal with one or two aspects of the carburation problem I am aware I am on very controversial ground, and am perfectly prepared upon further research and better understanding to modify the views I now hold. The conclusions set forth here are based upon a series of experiments I was privileged to undertake under the direction of a leading English authority upon carburation. The fundamental difficulties in the path of successful two-stroke carburation are two. (1.) Half the carburetter, *i.e.*, the crank case, has to be designed primarily to house the crankshaft and its bearings, its function as half the carburetter being absolutely ignored. (2.) The tacking on of a carburetter which has been developed through long years for service on four-strokes on which it functions passably well. But on a two-stroke some of the very features which have been painfully developed as absolutely essential to four-stroke service become positive drawbacks. One may cite the enrichment of the mixture at slow speeds as a definite instance.

The principal resultant defects of the foregoing are low thermal efficiency and four-stroking.

Four-stroking.

When this occurs at low and medium speeds, the cause is too rich a mixture; when at high speeds, bad scavenging is more often to blame except in those cases where a long period of port opening is accompanied by a small induction port which causes the air

Some Thoughts on Two-strokes.—

speed to get too high despite the fully opened throttle, and one comes back again to too rich a mixture.

Four-stroking will be noticed to commence when the load is lightened beyond a certain point or removed altogether. It will be naturally asked "How has the removal of the load power to enrich the mixture?" I humbly advance the following thesis for the consideration of the experts.

There is to a carburetter with a fixed jet size a certain air speed which is productive of the best results for drawing the correct amount of petrol per unit of time. Upon the ratio of air speed to jet size depends the quality of mixture supplied to the engine. Air speed is governed by the two factors piston speed and throttle opening. If piston speed remains constant, air speed becomes higher as the throttle is closed, and lower as it is opened. Inversely, if throttle opening remain constant, air speed will follow piston speed, rising and falling with it.

Air Speed and Petrol Flow.

There is, therefore, an absolutely definite ratio between the jet size, which governs the fuel supply, the "air speed," the "throttle opening," and the "piston speed." These four factors must be proportioned according to the load against which the engine is working to produce the correct quality of mixture. Load controls piston speed, and when, with the three other factors having been set against load, it is lightened or removed, the four factors become disproportionate, the "piston speed rising" out of proportion to the throttle opening, which in its turn causes the air speed to rise and the mixture to become too rich to fire until the resultant brake effect results in a momentary return to normal conditions.

The quality of mixture called for is governed by the crank case compression ratio, the cylinder compression ratio, and the port timings which govern the amount of spent charge left in the cylinder. The margin between the rich mixture required to function successfully upon a two-stroke and that which is over-rich is very slight.

Varying the Jet Size.

The answer to the foregoing problem should be sought for in the possibility of obtaining infinite variation of jet size (otherwise fuel supply) to the variations of air speed. I do not wish to infer that the mixture should remain constant in quality, but the carburetter should be so arranged that as the load falls the mixture weakens. The trouble with modern automatic and semi-automatic carburetters is that they have to be on the unduly rich side in order to climb well without reducing the air, and they cannot, therefore, give a two-stroke a sufficiently weak mixture for low speeds. When the air is partly cut off at the same time as the throttle, the enrichment of the mixture is altogether disproportionate, and the effect is that of a small carburetter fully opened with a big jet in it. This is brought strongly home to one when experimenting with such carburetters as the Wilkinson twelve-jet or the Zeta, or fixes a handle-bar control to the first variable jet pattern B. and B., in any of which the fuel supply can be controlled from the handle-bars. With very delicate manipulation and expert handling extraordinary results can be got; four-stroking can be induced or banished at every and any speed at the will of the user. But only the most expert or others after long practice could do this. For ordinary easy everyday driving they are out of the range of practical motoring.

The nearest approach to the ideal two-stroke carburetter as offering the greatest possibility of variation of mixture in the hands of the ordinary user is, to my mind, the Cox "streamline". The single-lever Amac also gives promise of being adaptable by variation of the size of the top vapour hole in the adapter. Both

One of the smallest of two-strokes, the Velocette, negotiating Harden Bank. Both in hill-climbing and speed events the two-stroke engine has this year done remarkably well

Some Thoughts on Two-strokes.—

these carburetters, by hooding their jet after the Claudel-Hobson principle, deliver the fuel to the main air stream in an atomised condition, which assists better results by providing gas, drier and less likely to recondense. One ideal to be sought for is delivery to the crank case of a perfectly dry gas which would be incapable of recondensation owing to the large surface exposed to the rush of cold air. Under present conditions matters would be considerably helped by the crank case being shrouded and warmed.

The Position of the Float Chamber.

Another complicating factor of the problem is that the pull or suction exercised by the engine upon the carburetter is, in the case of a two-stroke, infinitely more sudden and violent than on a four. On the uncovering of the induction port the carburetter is suddenly exposed to the pull of the maximum vacuum effect of which the engine is capable. On a four-stroke the carburetter is not exposed to the effect of a high vacuum immediately the valve is opened, it is exercised more gradually by the descent of the piston. It is but very little exaggeration to say that a two-stroke pulls more fuel out of the jet than it can assimilate at one moment, and flings the surplus out of the carburetter the next.

Another entirely unnecessary aggravation of the four-stroking trouble is the fitting of the carburetter with the float chamber to the rear of the machine. This practice on the part of the assemblers of motor cycles has the disastrous effect of enriching the mixture just when one wants it weakened, *i.e.*, when descending an incline, and weakening it when one wants it enriched, when ascending a hill. Convenience of fitting surely cannot be held to be an excuse for deliberately making a machine four-stroke more than is necessary. It is certainly not the fault of the carburetter manufacturers. Many other sins can be laid at their door, but not this one. They are, I know, universally insistent on the float chamber assuming a forward position when the power unit is assembled. The improvement that fitting the float chamber thus will make to some machines is astounding. Frequently a smaller size jet can be fitted, as the level rises on hills, which is as it should be.

There is, I submit, an enormous opportunity for the invention of a carburetter designed solely to overcome the inherent shortcomings of the design of the present-day two-stroke, which would make four-stroking as much a thing of the past as misfiring is to-day upon a four-stroke.

When four-stroking at high speeds is due to bad scavenging much can be done to remedy matters by carefully thought out silencer arrangements. Not only in the direction of the entire elimination of back pressure, but in the induction of a partial vacuum which would assist in drawing the gases from the cylinder. Has anyone ever tried leading the exhaust pipe to the narrowest part of a large tube of ventural form, say, 3ft. long and perhaps 5 to 6in. in diameter, at the ends so placed that the air would rush through it whilst the machine was travelling? A very strong extractor effect should be capable of being created thus, and with practically no loss of power owing to resistance as is the case with fan extractors.

Lubrication.

I feel I cannot conclude without paying a mark of respect to the excellent system of lubrication on the Velocette of which I have never heard a complaint, and to the efforts of certain French designers to embody mechanical oilers in their units. Both are much needed steps in the right direction. V.C.R.

Accessibility—Brakes on Wheels.

WHETHER it is more desirable to make the wheel detachable without interfering with the brake or the brake without removing the wheel admits of some argument. I am referring more particularly to rear wheels which have their brakes applied to the belt rims, dummy or otherwise.

If the brake be applied to the inside of the V it in no way hinders the removal of the wheel for tyre repairs, but it is by no means easy to remove the brake itself for cleaning, and it is so placed that in wet weather it is likely to collect much mud, some of which, finding its way into the bearings, may militate sadly against the easy working of the brake—until the wheel is taken out. This is especially the case when the dummy belt rim is placed on the same side as the final transmission in a chain-driven machine. On the other hand, if the brake be applied on the inside of the belt rim instead of on the inside of the V, it can be removed without difficulty, but is very much in the way when it is necessary to take out the wheel. In the case of front brakes, when the choice lies between the rim brakes fitted to act upon the wheel rims, as on pedal cycles, and the belt rim brake as introduced by Messrs. Lea and Francis, there can be no two opinions. Wheel rim brakes are practically useless on motor cycles and should be obsolete. Some firms are certainly trying to make them so by sending out the most inefficient examples. During the last few months I have seen front rim brakes which, if the riders were so ill advised as to try to use them, turned round at the first application and caught in the spokes at the next.

Brakes on the Hubs.

Internal expanding brakes come into a different category; these are a part of the wheels themselves, and the whole must be removed together. This is but little extra trouble—just the removal of the controls and probably the taking off of the bolt which secures the anchoring arm to the frame. True, the brakes cannot be dismantled for cleaning without taking the wheels out of the frame, but this is seldom—if ever—necessary. I have been riding a machine so fitted for the last few months, and have not found it necessary to remove either wheel or brake. Now and then a bit of grit gets between the revolving drum and the stationary cover and makes its presence known by a slight tinkling noise, but it is easily got rid of by running a piece of paper or thin card round the brake between the drum and the expanding parts—the work of a moment only. J.H.W.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters must be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

THE TWO-STROKE AS A TELL-TALE.

Sir,—May I thank "Two-Stroke Enthusiast" for his kindly appreciation of my article. He is quite correct in supposing that in my remarks on perfect mixture I was referring to the four-stroke engine; in a two-stroke the effect of using a larger jet would be precisely as he describes when the petroil method of oiling is employed.

I, too, have had great satisfaction from the use of a W.S.R. variable jet with an Amac carburetter. J.H.W.

OUR CROWDED INNS.

Sir,—Our friend "Ixion," in the issue of September 2nd, gives his moral, "Book accommodation ahead at holiday times." Personally, I have not found this necessary, even in these times of limited accommodation. During my recent twelve days' tour in the south-west of England I experienced comparatively little difficulty in securing rooms, even though my holiday covered three days in Bank Holiday week.

I agree that a wash at the garage is not a bad idea if wishing to stay at the Hotel Superb or Hotel Splendide, so as not to give the commissionnaire any undue shocks. On two occasions, however, I was gladly received, wet through and well mudded up, at old push-cycle hostelries.

R. GYLL.

STANDARD MACHINES IN TRIALS.

Sir,—The man in the street is apt to find present-day competition very misleading. For instance, a manufacturer wins a race with a freak, which gives one very little chance of summing up the merits of his standard model.

Everyone knows the necessity of racing experimental machines, but prospective buyers want to see how the goods supplied to the general public go on. They would have a chance if in future T.T.'s manufacturers had to enter one machine of the committee's selection for every one of their own selection.

The race officials would have the right to select their machines haphazard from any stock they fancied, and keep them locked up till the start of the event.

This would also ensure stuff being turned out in a serviceable condition, which is not always the case nowadays.

Sheffield. WANTED A GOOD MACHINE.

A MYSTERIOUS ACCIDENT.

Sir,—While passing through Savernake Forest, on the Bath Road, recently I had an accident, the probable cause of which raised much argument among my motor cycling friends. Not having arrived at a satisfactory explanation, I venture to submit the details to your readers, one of whom, perhaps, has had a similar experience.

I was riding at an easy touring speed when suddenly I lost consciousness. When I regained my senses I was on my way to hospital in the car of a gentleman who saw me fall. The policeman, who later recovered my machine, informed me that I had wobbled from side to side about six times, and then collapsed in the middle of the road.

The result of the accident, of course, has rendered me *hors de combat* for about a month

The possibility of falling asleep in the saddle is eliminated by the fact that I had only done about fifty-five miles. In addition to this, my health at that time was normal. I have never fainted in my life, and I felt no blow. I am therefore at a loss to understand why I petered out like that.

My mount is a 4 h.p. Triumph, solo, which is not damaged in any way. F. A. BOYCE.

WHAT IS HAPPENING TO THE TRADE?

Sir,—Although venturing upon a very threadbare subject, I cannot allow "Pedestrian's" letter to go unchallenged. From my numerous conversations with owners of well-known makes, I gather that only one or two give cause for *general* complaint, most of the other grouses being admittedly accountable for by the difficulties under which the manufacturers are working.

Last year, in ordering spare parts from the Triumph works, I obtained extremely prompt and courteous attention. This year, the Ariel works have overhauled a gear box for me (damaged by a faulty ball-race covered by no guarantee of theirs), replaced whatever was necessary, and returned the box by passenger train, *without making any charge whatever.*

That there *are* offenders, even among high-priced makers, seems unfortunately true, but not to the extent of justifying "Pedestrian's" sweeping claim that good service is the exception. With the usual disclaimer,

ALAN GOODFELLOW.

THE SILENCE TEST IN THE SIX DAYS.

Sir,—May I be permitted to express the opinion of an ordinary touring motor cyclist as regards the awarding of marks in the A.C.U. Six Days Trials?

I understand this to be a reliability trial, with the special object of testing machines as regards their general reliability, hill-climbing capabilities, simplicity, and easy handling for general touring purposes.

I consider that the A.C.U. method of deducting marks under the heading "Silence" puts a severe handicap, and means injustice to the single cylinder. The Sunbeam, P. and M., and Triumph have all suffered from this cause, although it is a well-known fact that the first mentioned is one of the quietest of touring machines, whilst the majority of twins have scored heavily on this point.

I notice that the team (composed of two-stroke twins) winning the "Manufacturers' team prize" did not lose a single mark under the silence heading, whilst the second team (composed of four-stroke singles) lost eighteen marks for this cause. As there is only a difference of sixteen marks between the two teams, the award would have gone to the latter team if it had not been so unfairly handicapped.

Trusting you can spare the valuable space for this effusion,

Didsbury. SINGLE-CYLINDER ENTHUSIAST.

THE MOTOR CYCLE AND INDIAN EXCHANGE.

Sir,—Having been in India since 1917 until quite recently, I am naturally interested in the references to that country in the letters on page 243 of your issue of August 26th, 1920.

I endorse what is said in the first letter, namely, "Take your own machine to India." It follows from what is said in the next letter (to which I refer) from "India" that it is sound advice. Nearly every motor cyclist out there would say the same.

In the letter from "India," under the heading "Manufacturers' Treatment," there is a statement to the effect that £206 13s. 4d. is equivalent to Rs. 1,600; or, in other words, that the exchange is 2s. 7d. per rupee. I do not think that this statement can be considered exactly accurate at present.

It is true that the exchange was as high as 2s. 7d. for a short time, but that was at least eight or nine months ago, if my memory is correct. It has fallen considerably since then, and is now, I believe, between 1s. 10d. and 1s. 11d. So

I would ask whether your correspondent is certain that the exchange was as good as 2s. 7d. when the Indian agents he refers to paid for these English machines. For, if they were not so fortunate as to reap the benefit of this high rate, one can hardly expect them to sell their goods as if they had.

Thus, it appears to me an exaggeration on the part of your correspondent to suggest, or say, that the exchange is still as high as 2s. 7d.

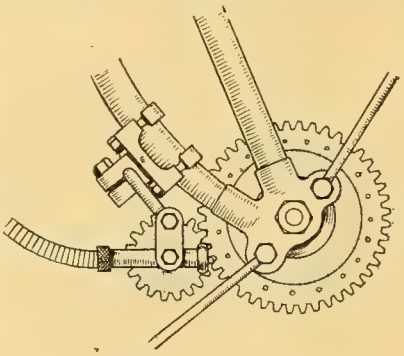
However, I do not deny that they are terrible profiteers, and think that some form of "Profiteering Act" would be beneficial in India, if it were possible, for the motor cycle agents are not the only culprits; a great many other shopkeepers are just as bad. ANOTHER INDIA.

Ryde.

SPEEDOMETER FITTING.

Sir,—We notice in your issue of Thursday, August 19th, a letter from a correspondent respecting some trouble he has had with his speedometer.

For obvious reasons he does not say the make, but unfortunately this is apt to be misleading to a large number of people. We should like "Speedometerless" to know that for a considerable time we have been supplying motor cycle speedometers, the fitting of which in no way interferes with the spindle nuts, as the brackets are secured on the fork by special clips, which in no way interfere with the front wheel.



A Watford speedometer fitting which does not interfere with the spindle nuts.

The same arrangement is also utilised for certain machines necessitating rear wheel drive, and the illustration will show you our method very simply.

ALFRED E. TRENAMAN.
NORTH AND SONS, LTD. (Watford Speedometers).

Sir,—With reference to a letter about speedometer fitting by "Speedometerless," in your issue for August 19th, it may be of interest to some of your readers to know that on August 17th I had a somewhat similar accident. My machine, also, was a B.S.A. and sidecar, with speedometer fitted by the agents. The first warning I had of trouble was, after fifty-eight miles, to find the machine making diagonally for the right-hand side of the road, and myself apparently unable to control the steering.

The damage sustained by the front fork was just as "Speedometerless" described, viz., near side of front fork bent outwards, off side quite true, wheel spinning truly on the spindle, and apparently undamaged, the nut belonging to the off side of the spindle missing, and spindle thread undamaged.

The motor cycle agent who came to my rescue discovered and explained the cause of the accident. I now quote an extract from "Speedometerless's" letter: "The front spindle nut is so shaped that it has a collar which fits into a circular rebate in the fork end for the purpose of preventing the spindle from coming out of the slotted fork end unless screwed back several threads. The agents, in fitting the speedometer, had merely slipped the clip holding the smaller toothed wheel over the collar on the nut, and then screwed up. The thickness of the speedometer clip is such that the collar of the nut, instead of projecting well into the rebate, was only in to a depth of about $\frac{1}{50}$in. The result was that the function of the rebate in the fork end and the collar on the nut was completely destroyed. The retention of the spindle in the slotted fork end must now rely entirely on the non-slipping of the nut when screwed up."

My speed was about 20 m.p.h. I was fortunately thrown clear, and sustained only slight injuries. The cost of repairs to the machine will be about £25, fortunately covered by insurance. Had there been an occupant in the sidecar the results must have been fatal, for the machine, after colliding, ricochetted back into the middle of the road and turned upside down. I hope that the warning of these two accidents will prove sufficient to cause all owners to inspect their speedometer fittings, if such are used.

N. P. TOWNLEY.

THREE SHIRES CENTRE A.C.U. TO BE FORMED.

Sir,—Regarding the paragraph in your issue of September 2nd, headed "A.C.U. Midland Centre," by the united request of all our members, coupled with similar requests from several clubs in this locality, we have decided to form another centre, for which the title at head hereof might be a suitable one.

All the delegates who attended the meeting in Birmingham were representative of clubs either in or near that city, and, although the Birmingham Centre presumes to cover four counties, the meeting was in no way representative of them.

Worcester was, I think, the only provincial club represented in the true sense of the word, so that if a decision was arrived at by the meeting to the effect that the time was not yet ripe for the formation of another centre, then this decision was arrived at by representatives of clubs from either in or near Birmingham only, who have no authority whatever to come to such decisions.

J. A. NEWMAN,
Hon. Trials Sec. Worcester and Dist. M.C.C.

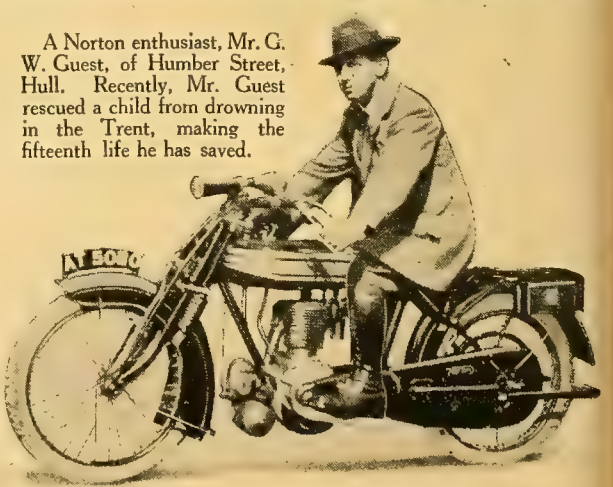
PETROL CONSUMPTION.

Sir,—In my letter which appeared in *The Motor Cycle* for September 2nd, stating that my customers got from 50 to 70 m.p.g. on the Scott, I omitted to mention that these mileages were with sidecar, and also, of course, that the carburetter was quite automatic, and all the fine variations of speed are obtained by the movement of one lever only.

C. BINKS.

Sir,—I note with interest Mr. Binks's challenge to Scott riders, but would like to point out that he is not offering them conditions equal to those under which he proposes to ride himself. In the first place, he reserves the right to set the pace. Now, with this in itself, one has no quarrel, but his opponents would naturally like to know what this pace is likely to be in order to tune their machines for economy at that speed. In the second place, Mr. Binks makes it a condition that the competitor keeps within ten yards of him. This is really a bad handicap (but I do not wish to infer that it was suggested with that intent), as it is common experience that when one tries to keep a given distance behind another rider one has to accelerate and brake very much more suddenly than one would otherwise when doing the same average.

As destructive criticism is of little value, I would like to suggest the following conditions as being fairer. They also have the advantage that a win under them would be more conclusive, and I am sure that this is what Mr. Binks would wish. Competition to take place over a settled course, which should be the shortest road distance between two points. A minimum *average* speed to be set (= a time limit); low, if



A Norton enthusiast, Mr. G. W. Guest, of Humber Street, Hull. Recently, Mr. Guest rescued a child from drowning in the Trent, making the fifteenth life he has saved.

this is purely a freak test; higher, say, some speed between 18 and 30 m.p.h. if a test under normal conditions, for most Scott machines habitually put up a decent average. If possible, candidates should each be escorted by an unimpeachable representative of any well-known club (and, if necessary, the suggested £10 diverted towards paying their expenses). If there is to be no escort, the test will have little interest to the average rider, unless the start and finish be observed by club officials, the petrol tanks being sealed on top and at the drain, and both unions on the petrol pipe sealed. If any competitor elects to use petroil, his oil pipes should be first removed.

Under this scheme any number of competitors could take part, whereas it would be impossible for more than two to try and keep within ten yards of a pace-setter.

If Mr. Binks could do a really good mileage under these conditions, I think most riders would accept the figures as such, and a score would have been made for his carburetter; but I am sure he would be disappointed if the result were not received with more faith than are the results of a dark spiritualistic seance by the average man; and this is how most of us view an incompletely checked petrol consumption test.

I note that Mr. Gordon wishes to know why a Scott gives a better mileage with plugs in the cylinder head than with them in the side. When the plug is in its standard hole it is pocketed about ¼in. deep, and also the flame of combustion has to pass from it right to the exhaust port before all the gas is burnt. When the plug is on top the points actually project into the combustion chamber, and also the flame can pass in all directions, and has not to travel so far to complete the process. This has two results. First, the machine is much faster (in my case maximum speed increased from 40 to 53 m.p.h. with everything else standard); and, secondly, less unburnt gas is exhausted, and so the petrol mileage improves. However, such a change has its disadvantages, the greatest of which is that the machine will not pull so smoothly at slow speeds (for the spark is further from the transfer ports, and therefore takes place when the new charge is somewhat diluted with unburnt gas from the last). I am about to try and lessen this by using dual ignition plugs. Also, the plugs soot up quicker in this position; but, with the magnetos fitted, this does not matter if one point plugs are used. I find an ordinary Lodge with two of the points turned back to be ideal, but when all three gaps are set as sent out, the Scott is no longer a machine of which one may be proud. A. B. K. WATKINS, M.B., B.S.

Sir,—Further to my letter which you kindly published a few weeks ago. In view of the recent increase in the cost of petrol, I am very sorry that "Not Infallible" has not come forward with further information about his machine, particularly as I have had no reply from Messrs. Degory. That a great improvement can be made in the consumption of these machines by fitting a suitable carburetter—I am certain, especially after the performance of the winning team in the A.C.U. trial.

I agree with Mr. C. Binks's remarks about "fake" driving with his carburetter. This instrument can be made very sensitive, and remarkable results obtained, but on a long run I for one do not wish to bother with the micrometrical adjustments of the air lever necessary every time I move my throttle.

Regarding his challenge, I would suggest a run from his works to, say, Glasgow, sealed tanks, and an average speed of 20 m.p.g. When I get a carburetter to suit my 'bus I will take him on these terms.

Will Messrs. Scott give further particulars of Amac carburetters fitted to their trial machines? 75 M.P.G.
Manchester.

Sir,—*Re* Mr. Binks's petrol consumption challenge. The conditions laid down by Mr. Binks would debar some of us from accepting this, as, unfortunately, we cannot all afford to give £10, owing to other responsibilities.

Personally, I have not a Scott machine, but I have a carburetter which, I think, will equal Mr. Binks's instrument, both as regards economy and power. It is my own invention, and if Mr. Binks is prepared to alter the conditions of his challenge I should be pleased to accept.

The following would seem to me the best way of testing the instruments, and fair to both parties. An experienced driver (selected by the Editor) should have the instruments handed over to him (after tuning), and should be used on the same machine, under the same conditions, and roads, and the results published in *The Motor Cycle*.

My instrument is rather crude, being hand-made, but has been thoroughly tested on a 4 h.p. single-cylinder combination for the last two years, and patent has been applied for. All that I should require to know would be the make and horse-power of the machine to be used, so that I may tune the instrument to that particular model.

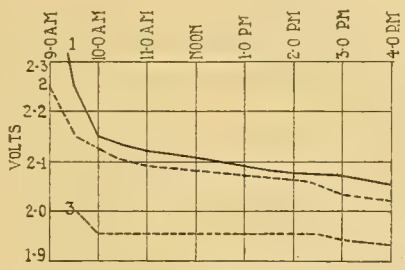
F. ACKROYD.

VARIABLE JETS.

Sir,—I am much interested in a letter in your issue of the 2nd inst., signed "Two-stroke Enthusiast," Manchester, especially as to his praise of the W.S.R. variable jet. I ride a Levis, and have fitted a W.S.R., but do not so far find any decrease in petrol consumption, as I expected. Certainly, I notice an improvement in two-stroking at low speed. Would your correspondent kindly give me some useful hints on the subject? (Colonel) G. WIEHE.

ELECTRIC LIGHTING.

Sir,—I was much interested in "One Who Has Had Some's" letter in *The Motor Cycle* for April 15th. I can sympathise with your correspondent in his experience with accumulators. I wonder if he has ever tried accumulators fitted with wood separators. This is one of the points which I think would tend to eliminate spilt acid. Then, again, a Coventry firm turns out accumulators packed with glass wool, which absorbs all free acid. That reduces spilling to a minimum. The best method in my experience is not to have any liquid in the accumulator at all. This may sound rather strange. Nevertheless, I have accumulators working which are impossible to spill. They are filled with a mixture which, when set, forms a paste. I have made exhaustive tests, and find that the electrolyte, being practically a solid, gives increased support to the plates, and the danger of short circuits due to the paste from the plates falling through vibration is practically non-existent. Acetylene is very good in a way, but look at the trouble compared with accumulators.



1. Paste in cell 5·1 mixture at 1250 sg.
2. " " 6·1 " " 1250 sg.
3. " " 6·1 " " 1190 sg.
Cells discharging at approx ·75 amps.

Graph showing the discharge of a 2-volt accumulator.

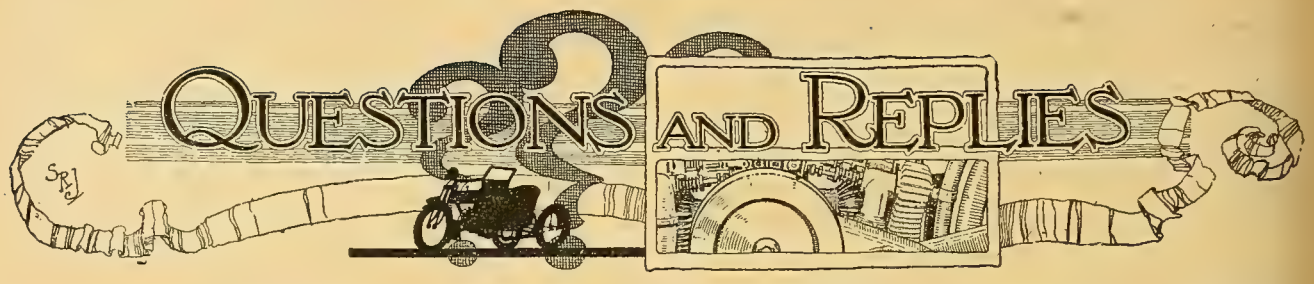
I am enclosing the results of a test which I and others have taken on some two volt paste filled accumulators. W.B.P.
Doncaster.

BOOKS AND MAPS FOR MOTOR CYCLISTS

Issued in conjunction with *The Motor Cycle.*

	Price net.	By post.
"MOTOR CYCLES AND HOW TO MANAGE THEM." The standard handbook of the motor cycle. Covers every subject relating to all types of motor cycles, their management and care. Twenty-first Edition. Just published	2/6	2/10
"HINTS AND TIPS FOR MOTOR CYCLISTS." Containing over 400 useful "wrinkles" and helpful hints in regard to motor cycles. Seventh Edition.	2/-	2/3
"TRACING MOTOR CYCLE TROUBLES." A reliable system for tracing motor cycle faults and of remedying any trouble when found. Fourth Edition.	2/-	2/3
"THE MOTOR CYCLE" ROAD MAPS England and Wales, Scotland. London (showing roads into and out of London and avoiding London). Mounted on linen. Set of three, complete in case.	5/6	5/10
"THE MOTOR CYCLE" ROUTE BOOK. With 32 pages of Road Maps of England and Wales, Scotland, and the London District. New Edition. Just published	5/-	5/4

Obtainable by post (remittance with order) from ILIFFE & SONS Ltd., 20, Tudor Street, London, E.C.4, or of leading Booksellers and Railway Bookstalls.



A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not **must be accompanied by a 2d. stamped addressed envelope for reply.** Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Excessive Exhaust Noise.

Is it absolutely necessary that every motor cycle should have a silencer on? I am in possession of a 2¼ h.p. two-stroke, and have an exhaust pipe extending from the engine to the back forks with a fish tail end. The reason for my enquiry is that I was pulled up recently by a constable who asked if I had a silencer on. I explained the exhaust pipe as above described, and as he was ignorant of the regulation he made further enquiries of a motor engineer, and I fear he will charge me for using a noisy machine.—J.B.B.

A long exhaust pipe (if a silencer is not fitted) does not necessarily comply with the law. At the same time, however, the legal requirements are rather vague, as even if a machine is fitted with a silencer you may be proceeded against if, in the opinion of the police, the engine is unduly noisy. We would suggest that you make such alterations to the exhaust arrangement as will ensure the machine being reasonably silent.

Changing Magneto Direction.

(1.) Is there any reason why a magneto should not be run in the reverse direction to that intended by the makers, except that the action of the contact breaker wipe and heel would be reversed? Is it likely that any damage would be caused to the windings or condenser? The machine in question is an early type two-cylinder Bosch with plain bearings. This has for a short time been driven at half engine speed in the "wrong" direction (*i.e.*, counter-clockwise). The magneto works well, however, and I do not feel disposed to alter it unless there is some likelihood of damage to the windings, etc. (2.) Could the above-mentioned machine be used on a single-cylinder engine with advantage by removing one heel of the contact breaker?—G.B.S.

(1.) There is no objection to running the old type Bosch magneto in the reverse direction, except that the contact breaker is not mechanically suited to this alteration, and another one designed to run in the opposite way should be fitted. (2.) If you desire to use the magneto on a single-cylinder engine, you should remove one of the cams from the contact breaker and also the corresponding high-tension carbon brush. An improvement would be effected by lengthening the remaining cam so that the points remained open through approximately half a revolution, as is done on the single-cylinder models.

Fitting a Variable Gear.

I wish to fit to my machine (a fixed gear, belt-driven Triumph, a 1907 model) some suitable gear. Probably you can suggest the best kind of (hub) gear suitable, and the most durable, as the roads in this country (Newfoundland) are open for great improvement.—C.L.C.

Hub gears are no longer manufactured in this country, and we regret that we cannot recommend any suitable form of two or three-speed gear which you could fit on your machine to bring it in line with the latest models. Two gears which, however, we can recommend for light solo use are the Bradbury epicyclic two-speed pulley and the Philipson automatic governor pulley. Either of these can be fitted without structural alterations when the standard adjustable pulley is removed from the engine-shaft.

Using Magneto as Dynamo.

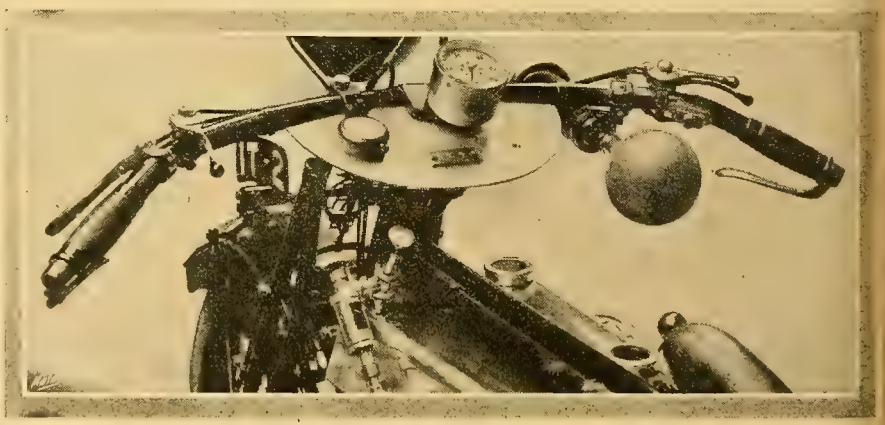
(1.) Having a Bosch magneto type A2, I wish to know whether I could turn it into a dynamo? (2.) Should I get a direct current by joining the primary and secondary ends of windings to a two-section commutator? (3.) What would be the voltage? (4.) Would the condenser on or off make any difference? (5.) What speed would be required?—G.A.H.

(1.) It would be possible to use the magneto as a dynamo, but it will not be particularly efficient. (2.) You could get a direct current by removing the existing windings and rewiring the armature with 22g. insulated wire, connecting both ends to a two-section commutator. (3.) The voltage would depend upon the amount of wire used. You would probably get from four to six volts, according to speed. (4.) The condenser would not be necessary. (5.) 1,500 to 2,000 r.p.m.

No Power.

I own a Wolf machine fitted with a T.D.C. two-stroke engine, no gear box, and Senspray carburetter. I have thoroughly overhauled the engine and all bearings. The piston and rings are A1. In assembling, I seccotined all joints, filled the tank with fresh petrol and oil (1 to 12). But although the engine fires regularly it develops no power, for directly I mount the machine the engine stops. The compression is good, and the magneto gives an excellent spark. The most doubtful thing is the carburetter. I have a No. 28 jet. Can you help me to solve the trouble? I purchased the machine second-hand, and it has never developed any power.—E.H.

The details you give are very incomplete, and we cannot give you anything more than general suggestions. Possibly the timing is too far retarded. The spark should occur when the piston is on top dead centre, with the ignition control fully retarded. If the magneto is not of the variable type, the spark should occur about 6 mm. before the piston reaches the top of the stroke. The lack of power may be due to the piston having been refitted with the deflector at the wrong side. It should be nearest the transfer port.



INSTRUMENT BOARDS FOR MOTOR CYCLES.

As a means of carrying the speedometer, watch, and switches, Mr. L. Keith Clayton, an enthusiastic Sunbeam owner, of Castle Bromwich, has fitted a polished aluminium "dash" to the handle-bar of his machine. The tank is silver-plated.

THE OWERS CARBURETTER.

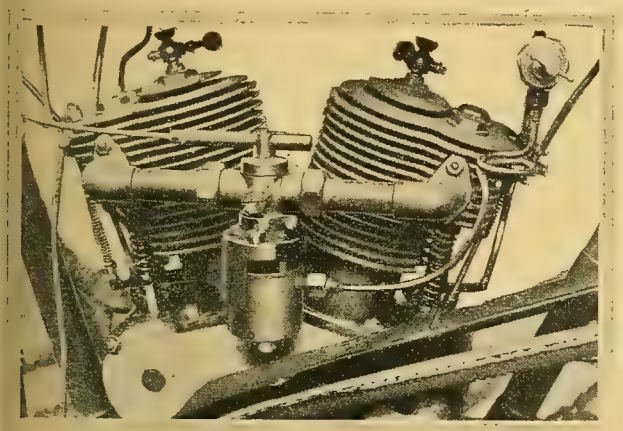
An Unusual Type of Single-lever Instrument.

At a time when the single lever carburetter is making considerable strides in the public favour, it is interesting to study the device which has been produced by Mr. J. Owers, of 10, Calthorpe Road, Banbury, since his design differs very considerably from the general run of automatic carburetters.

In the carburetter under discussion, a serious attempt has been made to vary the rate of fuel delivery to suit the speed of the engine as well as the throttle opening. Briefly the instrument consists of a mushroom throttle controlled by a cam rod, and an air valve operated by engine suction. The air valve contains a tapered needle, the travel of which is limited by a rod passing through the throttle spindle and actuated by a groove in the cam rod before mentioned. It is, however, in the detail of this air valve and needle that the main feature of the carburetter lies.

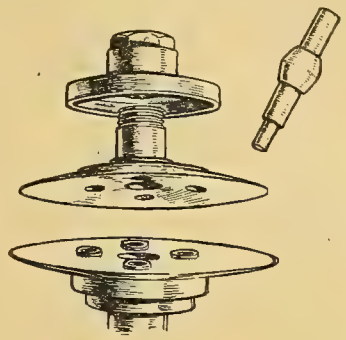
Annular Float Chamber.

Petrol is fed from an annular float chamber up a tube, which forms a guide for the main air valve past the regulating needle valve, and finally to the mixing chamber through a narrow space left between the two discs which form the air valve.



The Owers carburetter fitted on an engine designed and built by the owner ten years ago.

The top of the needle valve forms a subsidiary air valve and lies in a chamber formed in the top portion of the upper disc.



Construction of the Owers jet and vacuum chamber, with an enlarged view of jet needle.

This chamber is in communication with the atmosphere through a series of ports, which are acted on by the relative position of the air valve to the needle. Thus, when the throttle is opened, the main air valve—and with it the needle valve—is raised by engine suction; when, however, the travel of the needle valve is arrested by the control rod, a further raising of the main air valve causes the ports in communication with the vacuum chamber to be first partially closed, and then opened, so increasing and diminishing the rate of petrol flow. Now, as the action of the air valve is controlled by the speed of the engine and the movement of the jet needle by the opening of the throttle, it is possible to obtain almost ideal mixture conditions, and we may state from seeing the carburetter in action that it provides wonderfully low revolutions, instant acceleration, and smooth and steady running at all speeds.

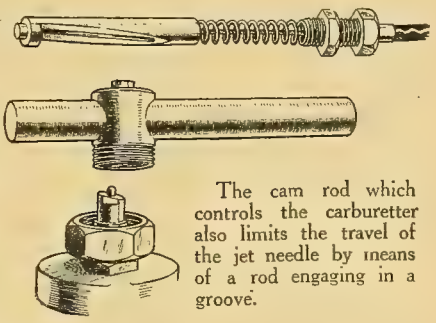
So much for the principle of the carburetter. The instrument, however, includes several other interesting features. For instance, the guide of the air valve extends below the level of the petrol in the float chamber. At its lower end it is enlarged to form a dashpot, and being always submerged it is, of course, dustproof.

A Carburetter Safety Valve.

Another unusual feature is the fitting of a safety valve to save any possible damage due to a blow-back. The carburetter is thoroughly well made, and we understand that Mr. Owers desires to get into communication with anyone interested.

The motor cycle on which this carburetter was demonstrated is particularly interesting, in that it was designed and manufactured throughout by Mr. Owers more than ten years ago. The engine is a narrow angle V twin of about 500 c.c. Two camshafts are employed, and each operates the inlet and exhaust valves of one cylinder. Ignition is by low-tension magneto, and the firing point is variable by varying the "tweaker" cam.

In addition to the usual controls means are provided for lifting either or both exhaust valves, which forms a handy device for testing purposes.



The cam rod which controls the carburetter also limits the travel of the jet needle by means of a rod engaging in a groove.

WANTED: A SIMPLE DYNAMO.

THE autumn is upon us, and shortly the evenings will be closing in, and some thought must be given to the lighting equipment of our machines.

In my own case, I travel but seldom after dark, the limit of my ordinary riding by lamplight being perhaps a two-mile run once per week. Occasionally, however, I have to do an all-night trip in order to return to the office post haste with the report of some distant trial.

Hitherto, I have persevered with acetylene, which has given me excellent service. Electric lighting is out of the question in its present forms: the accumulator system (without dynamo) cannot be depended on for two ten hours' continuous rides in the darkness on consecutive nights, while the high capital cost of a dynamo or magneto-dynamo outfit cannot be justified for the few night journeys involved.

My new machine, therefore, must be fitted with an acetylene set, and I must still endure the irritation of generator charging and cleaning before each of the occasional ten-minute runs which I take; for the all-night journeys I am fully content with the system.

An Alternative Lighting Set.

What I *should* like to fit, however, is a miniature screw-bulb electric adapter, in each acetylene lamp, connecting them all to one of those small friction-driven dynamos such as appear to give excellent service on pedal cycles. I doubt if one of these devices would function satisfactorily when driven from the outside flywheel, used at odd intervals throughout the winter, as they appear to be somewhat lightly constructed.

A simple permanent magnet type of dynamo of this description might be made and sold for quite a modest sum, and while it would not supplant the powerful acetylene head lamps with which my outfit is equipped, it would justify the expenditure by its convenience on brief and intermittent outings. The light given need not be greater than is necessary to comply with the law, and the adapters could be so placed in the head lamps that the acetylene burners need not be moved.

Postal Rates—a Reminder.

Readers are reminded that the new postal regulations are now in force, and that surcharged letters are often delayed as to delivery. We mention this on account of the large number of insufficiently stamped letters that still reach this office.

The Motor Police.

The County Police of Lancashire, who have acquired a Triumph and sidecar, provide another example of the new speed control, *i.e.*, by following the suspected vehicle and noting speedometer readings. When the proposed abolition of an arbitrary speed limit is carried into effect, this form of activity will be rendered futile, but no doubt the outfit will be used for road patrol duties.

A Two-stroke Trial.

Evidently the Leicester and District M.C.C. have touched a responsive chord in the competition world, for they are receiving so many outside enquiries regarding their forthcoming two-stroke trial that they have decided to throw it open to all, making non-member entrants honorary members for the day. This event, which takes place on the 26th September, has an attractive prize list, and is confined solely to two-stroke machines. Particulars may be had from Mr. J. O. Randall, 37, Little Holme Street, Leicester.

Imports and Exports for August.

Importation of motor cycles is on the up grade. There was in August an increase of £14,705 in the value of imported machines over the previous month, the total amount being £65,884.

IMPORTS.

	1913.	1919.	1920.
Number of motor cycles	80	166	684
Value of machines and parts ...	£13,536	£12,985	£65,884

EXPORTS.

There is a slight decline in the exportation of motor cycles for August compared with July. But even so, it is satisfactory to observe that the high level of last month is so heavily maintained. The figures for July were £271,078, against recorded the previous month.

	1913.	1919.	1920.
Number of motor cycles	1,130	849	2,659
Value of motor cycles alone	£49,445	£58,748	£202,363
Value of parts and accessories ...	£15,888	£26,106	£63,203

A Protest.

A letter from F. J. Watson, the well-known Ariel rider, informs us that he withdrew his 6 h.p. sidecar outfit from the recent A.C.U. six days trials, merely as a protest against the conditions, and not for any mechanical reasons.

IMPORTANT DATES.

Sat., Sept. 18th—
Liverpool M.C. Open Reliance Cup Trial.

Sat., Sept. 25th—
West Midland Open Reliability Trial, organised by the Wolverhampton, Redditch, and Kidderminster M.C. Clubs.

Sun., Sept. 26th—
Leicester and District M.C.C. Two stroke Trial.

Sat., Oct. 9th—
M.C. and A.C. Open Reliability Trial.

Nov. 29th Dec. 4th—
Olympia Motor Cycle Show.

Next Year's England-Holland Trial.

The rules of the Anglo-Dutch Trial provide that next year's contest shall take place in England. Already the provisional programme is being considered. The Dutch team will be entertained to lunch or dinner by the Birmingham M.C.C., the enterprising committee of that body having already extended an invitation to them. Likewise the Coventry and Warwickshire Motor Club will again take a part in the entertainment of our visitors from Holland in 1921, whilst the Worcester Cup has been put up by the Worcester and District M.C.C. for the best performance by a Dutch team rider. The Surbiton and District M.C.C. offered a cup immediately after the conclusion of the trial in Holland last month, and there is also the cup again offered by *The Motor Cycle*. Thus, early, next year's event to be organised by the Auto Cycle Union promises well, and, so far as club assistance is concerned, the Worcester and District M.C.C. is keenly anxious that the trial be held in the hop district, and will gladly assist in finding a suitable course. Already we have heard from correspondents in Holland that our fellow motor cyclists over there are keenly looking forward to their visit.

Special Features.

A TOUR IN THE HIGHLANDS.

SOME THOUGHTS ON TWO-STROKES

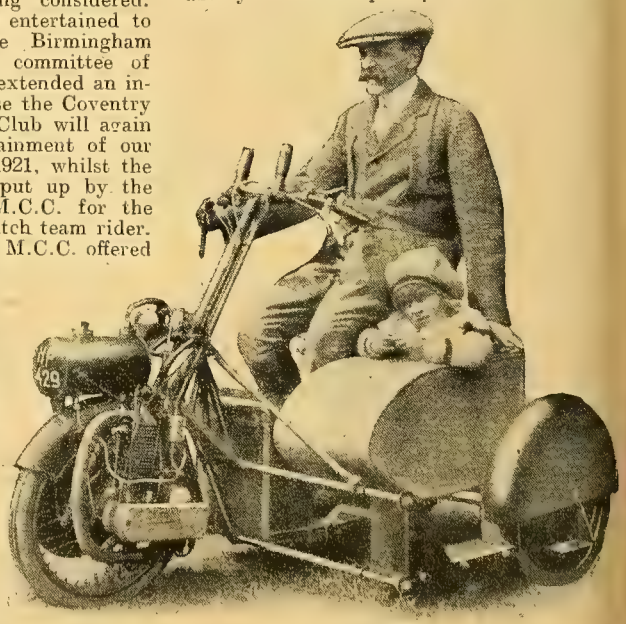
ROAD TESTS OF NEW MODELS.

An Echo of Chatsworth Park

The team event postponed at the East Midland Centre A.C.U. speed trials will be run off on September 25th on Clipstone Drive (North Notts.). The event is being held in conjunction with the Mansfield M.C. speed trials, and starts at 1.30 p.m.

Trade in British West Indies.

A letter has been received by the Department of Overseas Trade from His Majesty's Trade Commissioner in Trinidad. He states that an agent in Port of Spain is anxious to get in touch with the British motor cycle manufacturers, with a view to taking up an agency. It is pointed out that there are 206 motor cycles in Trinidad, the majority of which are of American manufacture, and that the main trouble which causes the absence of British machines, is due to the inability to obtain spare parts.



A 1½ H.P. AND SIDECAR.

Sooner or later the scooter and sidecar was bound to come. Here we have a miniature sidecar attached to a Mobile Pup, and although it is the last thing we should advocate, it serves its purpose very well.

Midland Police Activity.

The police were again active on Saturday and Sunday last examining licences and taking the names and addresses of drivers.

Police Traps.

Several notorious speed traps that have been active of late round about London were not working last week end.

Scotland Yard and the Abolition of the Speed Limit.

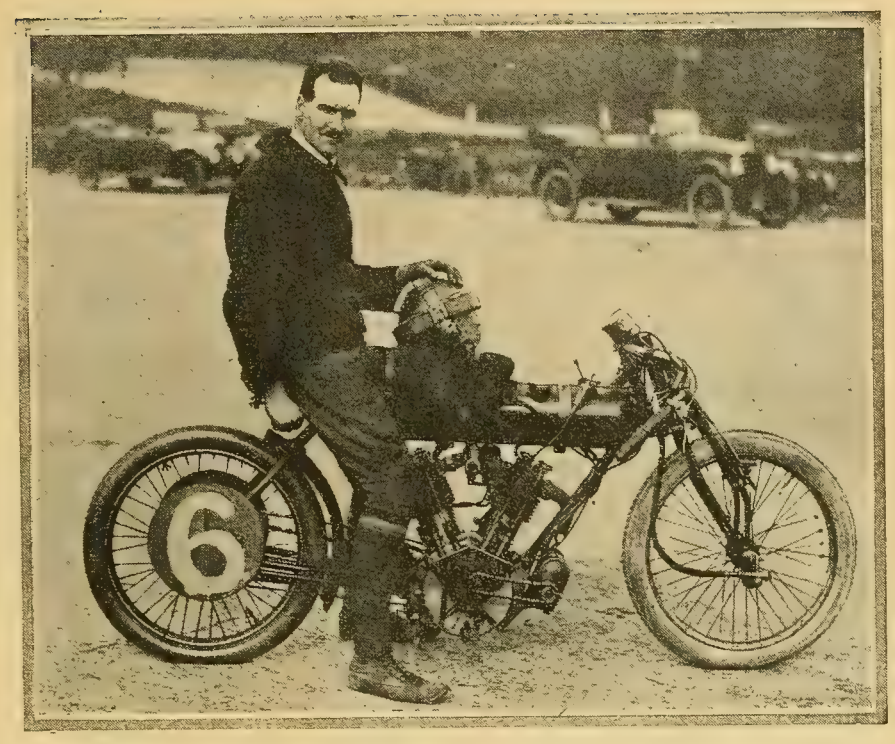
Daily paper assertions that the 20 m.p.h. limit is to be abandoned and motorists summoned for negligible and reckless driving are not confirmed by Scotland Yard. This subject will be discussed in *The Autocar* on sale to-morrow (Friday).

The Levis Trial.

The reliability trial which is being organised for September 26th by the Levis Athletic Club will be open to all riders of single-geared models of this make, provided that those who are not attached to the club become honorary members. Entry fee in the trial is 1s. (plus 4s. for honorary membership of the club). Entries close on Saturday next, and full particulars may be had from Mr. W. S. Banner, Levis Works, Stechford, Birmingham.

Ulster Two Days Trial Abandoned.

As was generally anticipated would be the case, the two days trial of the Ulster Centre of the Motor Cycle Union, which was fixed for Wednesday and Thursday of last week, had to be abandoned owing to the disturbed state of affairs in Belfast. As a fact, Belfast had resumed its normal dignified calm by the time fixed for the trial, but the decision to abandon the event had already been made. It was almost ironical that the trial should have had such an ending in view of the fact that it was intended as a substitute event for the End-to-End competition, which had been abandoned because of the disturbed state of affairs in the South of Ireland in July. Ireland's little civil war has made the lot of the trial-promoting bodies a somewhat difficult one during the past season, and the wonder is that so many events are held.



E. Remington (Nut-Jap), who attained 79·71 m.p.h. in the ten mile race at Brooklands on Saturday last, thus creating a new record in Class E.

The Clyno in the Scott Trial.

According to programme F. E. Palmer had entered a Wilkin in the Scott trial; he rode instead a 2½ h.p. Clyno. Although the smallest machine in the trial, he completed the course—a creditable performance.

Char-a-banc Speed.

At Hereford, a driver of a char-à-banc was fined £10 recently for driving a char-à-banc at a rate of twenty-five miles per hour. The Chief Constable said the char-à-banc when turning off one portion of the street to another nearly collided with a motor cyclist. Only the control which the motor cyclist had over his machine averted a collision.

A.A. and Increased Petrol Prices.

At a meeting of the executive committee of the A.A., a resolution was adopted protesting against the continued rise in the price of petrol and the neglect of the Government to take any steps either to control the existing supplies or to encourage alternative sources for the production of motor fuel. Following on this resolution, the Automobile Association is taking further steps to impress upon the Government the vital necessity for immediate action for the protection of the public, and the chairman, Sir William Joynson-Hicks, M.P., is urging the Prime Minister to fix a definite date to receive a petition recently signed by upwards of a million and a quarter persons.

A Scott rider, A. J. C. Lindsay, negotiating Amulree during the Glasgow Western M.C.C. Team Trial.

A SCOTTISH TEAM TRIAL

That included Two Ascents of Amulree.

CLUB members from many parts of Scotland gathered at the Amulree Hotel last Saturday to take part in the trial organised by the Glasgow Western M.C.C. Each club had to be represented by four members, two riding solo machines and two riding sidecars. The course was a difficult one to be covered non-stop, as it included the ascent of Amulree and the descent of Kenmore. The length of the circuit was thirty miles, *via* Kenmore, Aberfeldy, and back again to the Amulree Hotel, the distance being covered twice. The Edinburgh and District M.C.C. proved to be the winners of the "John Bull" Challenge Cup, which was the principal award.

A RECORD WEEK AT BROOKLANDS.

The Norton establishes New Records. Wooler and A.B.C. Successes.

THREE machines figured in the latest records established last week on the track at Brooklands, which has quite regained its old-time condition, and where one may see, every day, machines practising or actually attempting to raise the pre-war speed figures which are, in many cases, comparatively low.

On Tuesday, September 7th, H. H. Beach (3½ h.p. Norton and sidecar), broke and established several new records in Class G for sidecar machines not exceeding 500 c.c., and also altered the existing figures in Class H for motor cycles and sidecars not exceeding 750 c.c. His new records are as follows :

CLASS G.—MOTOR BICYCLE AND SIDECAR, NOT EXCEEDING 500 C.C.

	Time.	Speed. m.p.h.	Previous Speed. m.p.h.
200 miles	4h. 1m. 59⅘s.	49.59	10.66
250 miles	5h. 2m. 53⅘s.	49.57	-
300 miles	6h. 1m. 29⅗s.	49.79	---
4 hours	198mls. 492yds.	49.59	42 62
5 hours	247mls. 965yds.	49.51	10.71
6 hours	298mls. 1,204yds.	49.79	41.20

Amongst the details used on his machine were the following : Avon tyres, Pratt's spirit, Speedon oil, Philipson pulley, John Bull belt, Forward plugs, and Middleton sidecar.

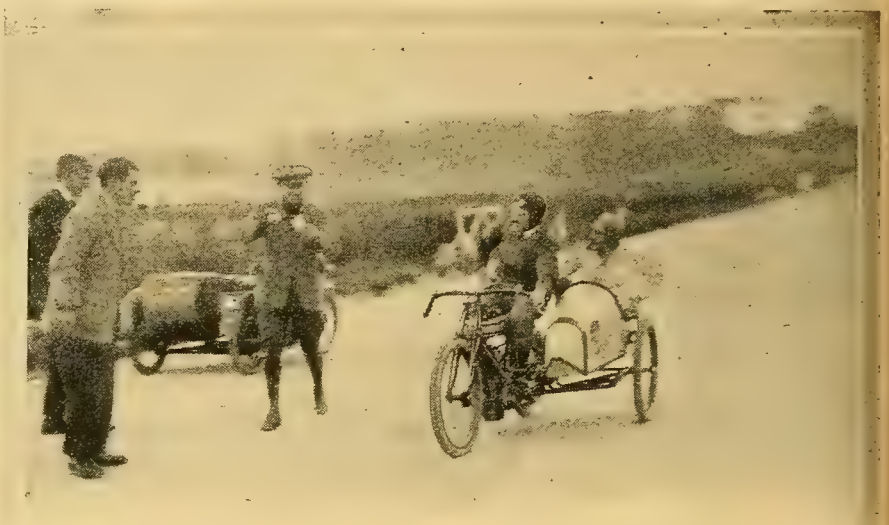
Two Flat Twins.

A hot sun throughout the day on Thursday last, September 9th, provided ideal conditions for a record day, and Mr. A. V. Ebblewhite, the official timekeeper, was kept very busy checking two machines, a 3 h.p. A.B.C. piloted by J. L. Emerson, and a 2¾ h.p. Wooler ridden by F. A. McNab, who succeeded in raising his previous speed in the eight-hour and 350 mile records in Class B (for solo machines not exceeding 350 c.c.), by 1.93 miles per hour in the former, and .84 mile per hour in the latter. Exceptionally bad luck befell him, for during his ten hours' running he broke a tappet, a piston, and a valve, whilst an oil leak in his rear cylinder caused considerable belt slip, which component he was obliged to change for a leather one. His new records are as follows :

CLASS B.—FOR MOTOR BICYCLES NOT EXCEEDING 350 C.C.

		Speed. m.p.h.	Previous Speed. m.p.h.
8 hours	319mls. 1,123yds.	43.70	41.77
350 miles	8h. 0m. 25⅕s.	43.70	42.86

Emerson (A.B.C.) put up a splendid show and, with the exception of a burst tyre, he had no other trouble. His speed was consistent and, in the second lap, worked out at 72.35 m.p.h.

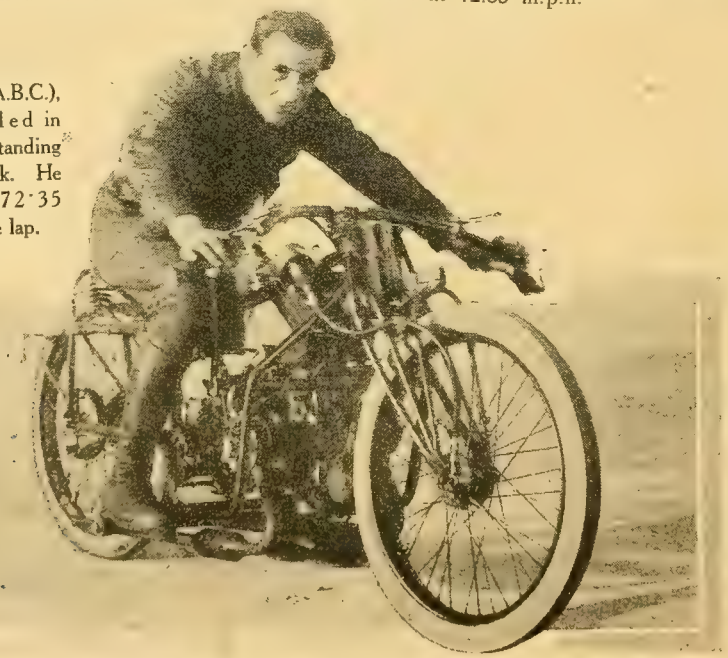


H. H. Beech (3½ Norton sc.) after lowering several records last Tuesday at Brooklands.

CLASS C.—FOR MOTOR BICYCLES NOT EXCEEDING 500 C.C.

	Time.	Speed. m.p.h.	Previous Speed. m.p.h.
50 miles	42m. 36⅕s.	70.40	69.43
100 miles	1h. 26m. 13⅗s.	69.58	68.47
200 miles	3h. 10m. 19⅘s.	63.05	61.61
250 miles	3h. 57m. 14⅘s.	63.22	59.73
300 miles	4h. 49m. 51⅕s.	62.10	59.72
350 miles	5h. 40m. 3⅘s.	61.75	59.72
1 hour	70mls. 787yds.	70.44	67.93
2 hours	130mls. 500yds.	65.14	63.68
3 hours	188mls. 482yds.	62.75	61.57
4 hours	252mls. 1,308yds.	63.29	59.88
5 hours	310mls. 991yds.	62.10	59.71
6 hours	371mls. 574yds.	61.88	59.77

The following equipment was used on his machine : Palmer tyres, E.I.C. magneto, Flixi carburetter, Wakefield Castrol and Pratt's spirit.



J. L. Emerson (A.B.C.), who succeeded in lowering many standing records last week. He accomplished 72·35 m.p.h. on one lap.

An Italian Championship.

A LONG distance race was held in Italy on September 5th to decide the "championship of the road." The course was a circuit of 24 km. (15 miles), commencing and finishing at Gallarate, and it had to be covered ten times, making a total distance of 240 kms. (150 miles). British machines performed well, securing one first, one second, and one third place, out of the four classes. American machines secured one first and one second place, whilst a Swiss make obtained another first. The remaining first place, two seconds and one third were taken by Italian models. The results tabulated are as follow :

350 c.c. CLASS.—1, Pietro Calvi (Motosacoche), 3h. 44m. 14s.; 2, Carlo Barioni (James), 3h. 47m. 5s. Winner's average speed 63.886 km.p.h. (40 m.p.h.).

500 c.c. CLASS.—1, Biagio Nazzaro (Della Ferrara), 3h. 11m. 21⅖s.; 2, Luigi Gilera (Gilera), 3h. 45m. 32⅖s. Winner's average speed 75 km.p.h. (47 m.p.h.).

750 c.c. CLASS.—1, Virginio Appiano (James), 3h. 33m. 31⅘s.; 2, Giovanni Bestelli (Gilera), 3h. 40m. 51s.; 3, Rinzo Castegneto (Frera), 3h. 47m. 25s. Winner's average speed 67.159 km.p.h. (42 m.p.h.).

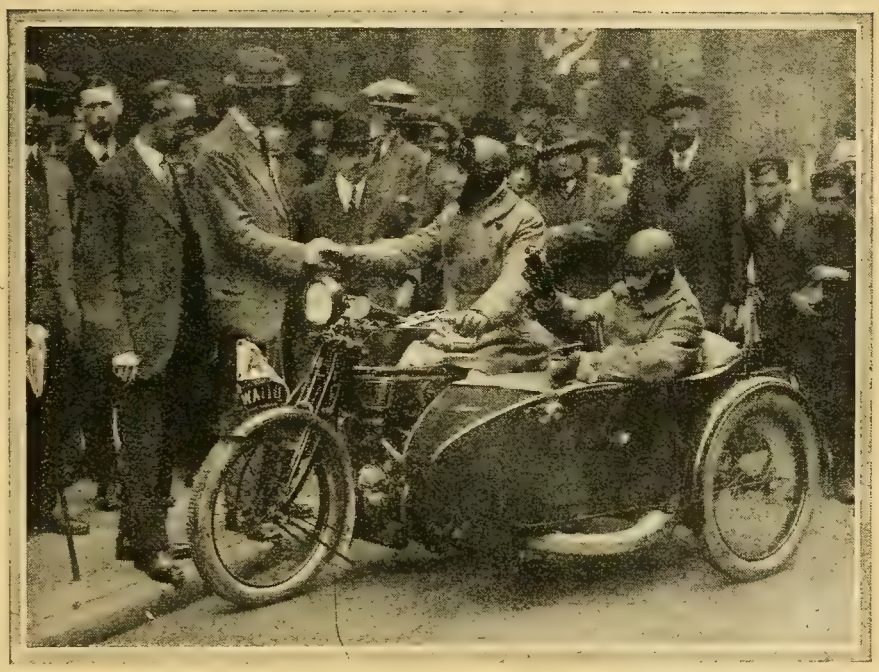
1,000 c.c. CLASS.—1, Edoardo Winkler (Harley-Davidson), 3h. 0m. 14⅘s.; 2, Miro Maffeis (Indian), 3h. 7m. 12⅘s.; 3, Erminio Visioli (New Imperial), 3h. 15m. 58⅘. Winner's average speed (fastest time of the day and championship) 79.559 km.p.h. (49.7 m.p.h.).

Round the Coast of Britain.

A Long Ride on a Single-cylinder Sidecar Outfit; 3,500 Miles in Twenty Days.

ON Wednesday, 8th inst., Mr. G. W. Wilkin (designer of the motor cycle bearing his name) started off from the premises of Messrs. J. Blake and Co., Bold Street, Liverpool, on an officially observed trial round the coast of Great Britain. He is riding a 4 h.p. Wilkin, with Mr. Barr, who has been appointed observer by the A.C.U., in the sidecar. The run is being carefully and impartially observed for general performance of the engine on all the various types of road encountered, hill-climbing, braking, lubrication, tyre wear, petrol consumption, and so forth. A great deal of useful data anent running costs and efficiency should be obtained from this trial. The rider is confident that his mount will justify his most sanguine hopes. Something like 3,500 miles will have to be covered, and Mr. Wilkin is hopeful of being able to complete the journey in about twenty days, despite any militating weather and road conditions.

Our latest news from Mr. Wilkin is that all is going well, and we wish him the best of good luck on his strenuous reliability trial.



Mr. G. W. Wilkin about to embark on his long coast ride. The complete journey will be in the neighbourhood of 3,500 miles.

London-Bala-Dunstable.

A Twenty-four Hours Trial held by the Essex Motor Club.

THE following members of the Essex Motor Club started at one minute intervals from 7 p.m. from the Old Gatehouse Hotel, Highgate, on a twenty-four hours' trial last Friday evening to Bala (Wales) and back to Dunstable: A. C. Rhodes (3½ N.U.T.), V. E. Leverett (8 Zenith), R. E. Humphreys (2½ Kingsbury), R. Weatherell (3 R. W. Scout), A. Stanger (5 Stanger), J. Stanger (5 Stanger), J. McBirnie (7 Indian), F. W. Applebee (2¼ Levis), V. Olsson (7 Indian), W. Simpson (7 Indian sc.), E. A. Bridgman (7 Indian sc.), D. S. Parsons (5 Rover sc.), P. D. Walker (4¼ B.S.A. sc.), Eric Porter (3 A.B.C. sc.), F. Savage (4 Indian sc.), E. J. Pittoch (5-6 James sc.), W. C. Hemy (6 A.J.S. sc.), W. A. Fell Smith (8 Blackburne sc.), J. W. Wills (2¾ Verus sc.), while S. R. Axford (3 A.B.C. sc.) and H. Lush (3 A.B.C. sc.) were non-starters.

The route lay through Dunstable, Daventry, Atherstone, Tamworth, Wellington, Shrewsbury, Welshpool, Llanfair, Dinas Mawddwy, Bwlch-y-Groes (observed hill), Bala, and thence back over Rhosgwalian (observed hill) to Lake Vyrnwy, Cann Office, Llanfair, and homewards over the previous road to the finish at Dunstable. Although the entry list was somewhat small, the trial was a sporting success for those members of the Essex Motor Club who entered, and good weather added considerably to the run.

Large Percentage of Finishers.

Five competitors failed to finish on time: R. Wetherell, J. Stanger, J. McBirnie, P. D. Walker, and F. Savage. The two observed hills—Bwlch-y-Groes and Rhosgwalian—gave a good deal of trouble to the riders and machines, the former being a very stiff ascent, and the latter full of cross gulleys and ruts.

McBirnie dropped out of the run on the outward journey owing to engine seizure. J. Stanger (5 Stanger) had gear box trouble on Rhosgwalian, and had perforce to retire; while R. Weatherell was reported to have broken the frame of the R.W. Scout machine entered by him. A trouble common in long trials befell A. Stanger in falling to sleep while actually riding his two-stroke Stanger. Both rider and machine overturned on the road, but it appears that Stanger only became fully aware of the happening after someone had sent him on his way again. Stanger's face swelled a good deal owing to the fall, but he finished at Dunstable on time.

One of the features of this trial was the finishing to schedule of the 2¾ Verus sc.—an excellent performance for this little machine.

The trial was well organised and enjoyed by the small body of enthusiasts who competed. The awards are gold, silver, and bronze "milestones" given by the club.

An Echo of the Six Days Trials—Mrs. Knowles's Thanks to the Competitors.

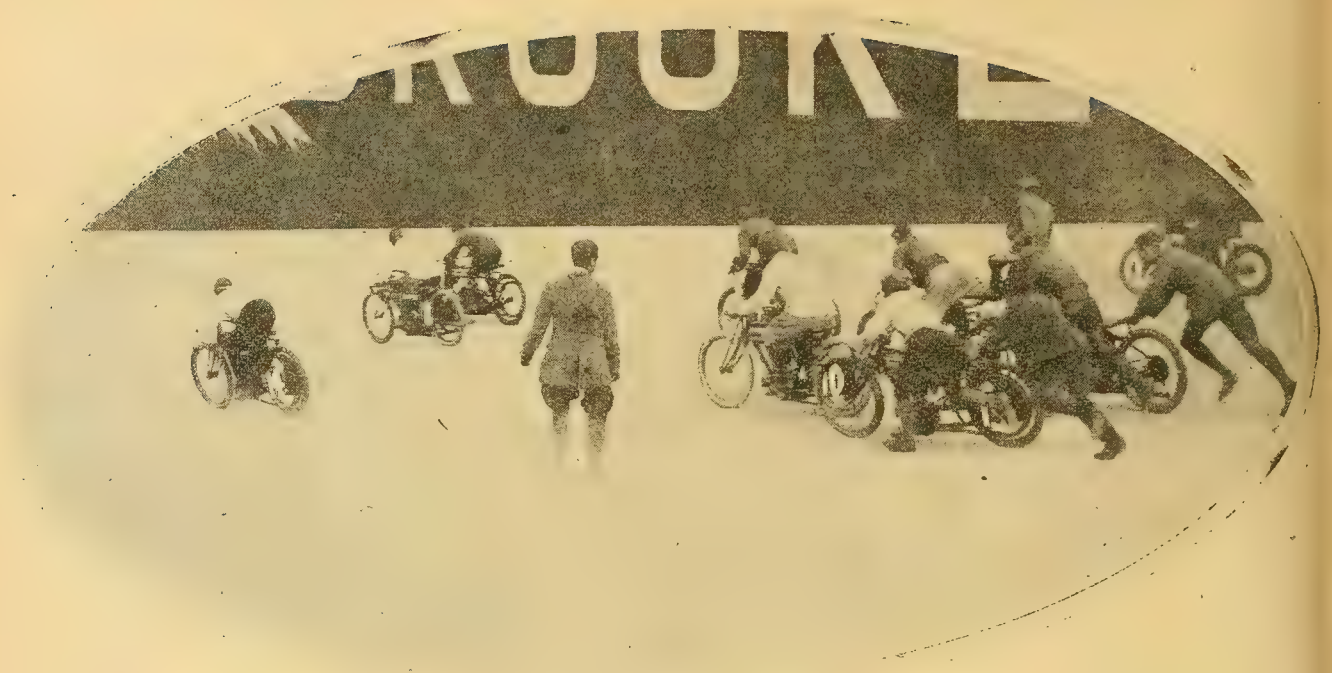
To the Editor of "The Motor Cycle."

SIR,—May I make use of your journal to convey my very grateful thanks to my fellow-competitors in the A.C.U. Six Days Trial for the most beautiful silver rose bowl which I have received from them to-day? I cannot possibly express my feelings adequately. I am more pleased than I can say, and it will be one of my most valued possessions, and a memento of a very enjoyable week. It more than makes up for the loss of a "Gold," which I might have received if I had not unfortunately been prevented from completing the trial. I should like to take this opportunity of saying how very good to me all the competitors were during the trial. It would be hard to find a more sporting and pleasant lot of fellows anywhere, and I much hope I shall have the pleasure of meeting them all again next year, and of thanking them in person for their noble present. Especially I should like to thank Mr. T. C. de la Hay and Mr. G. Dance, who, I see from your paper, were the originators of the proposal to give me a souvenir.

My thanks are also due to you for the trouble you have taken about it.

OLIVE M. KNOWLES.

Gissing Hall, Norfolk,
Sept. 10th, 1920.



Start of the one hour race for machines not exceeding 500 c.c.

BROOKLANDS ACTIVITY.

The Hour Record twice broken in one Week.

LAST week was a feast of records broken and re-established with bewildering rapidity. On Tuesday new 500 c.c. sidecar figures for 200, 250 and 300, and four, five and six hours were set up by H. H. Beach (3½ Norton sc.). Then on Thursday F. A. McNab (2¾ Wooler) again made another attempt on the 350 c.c. class and succeeded in improving the 350 mile, and eight-hour figures while at the same time J. L. Emerson (3 A.B.C.) established new times and speeds for all records up to 350 miles and six hours in the 500 c.c. His distance for the first hour was 70.44 miles, but this record was of short life, for on Saturday the remarkable speed of 71.68 miles in the hour was attained by Victor Horsman on a 3½ h.p. Norton, who competed in the hour race for solo motor cycles for engines up to 500 c.c.

The sequel to this race may rightly be termed the most sensational performance of a 3½ h.p. solo machine on the track this season.

A few minutes before the conclusion of the hour race Mr. Norton held a hasty consultation with Mr. A. V. Ebblewhite, and, since the meeting was over and the track clear, it was agreed that Horsman should be allowed to continue in an attempt to break other records. The Norton rider was stopped, and, after refilling his tank, he rapidly sped away.

All went well for the next threequarters of an hour. Lying low on the tank he swallowed up the miles at an exceptionally consistent speed, at times exceeding 80 m.p.h.

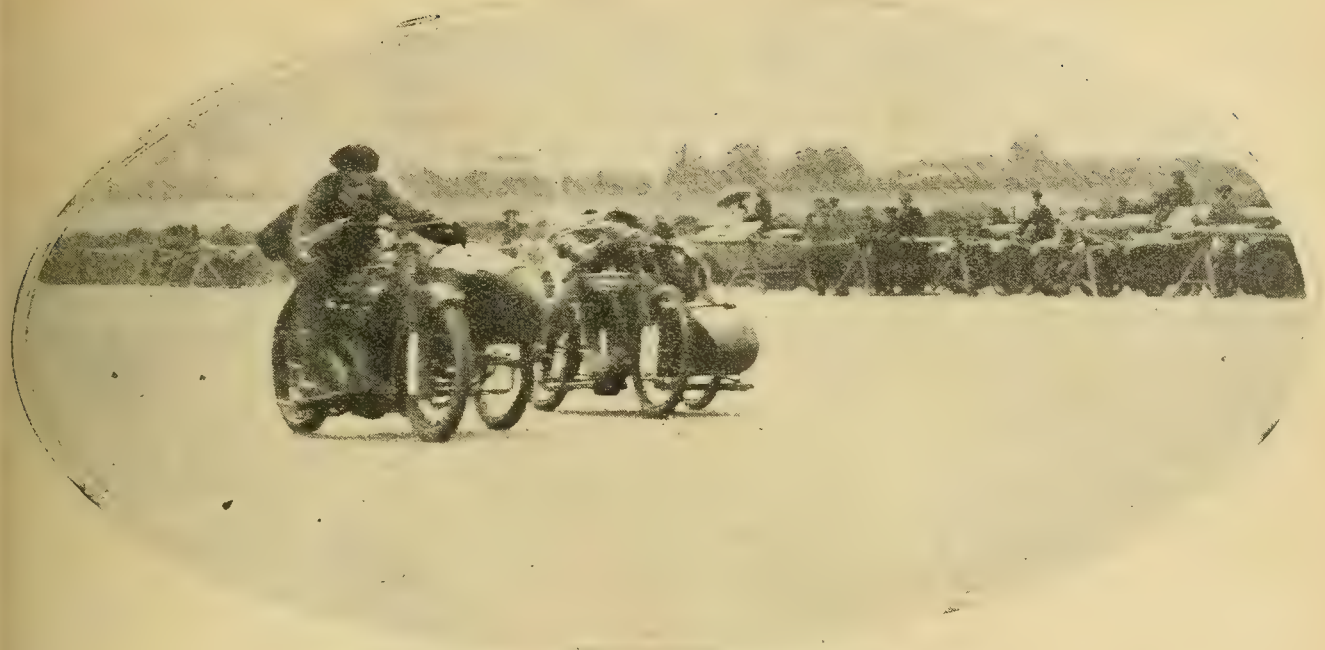
Many anxious faces were turned towards the clock dial, which, synchronised with the timekeepers' watch, slowly crept towards the second hour.

Slight anxiety swept over the excited crowd as Horsman's Norton, speeding by, showed signs of spasmodic misfiring. Pulses quickened as members of the Norton team ran out to stop the rider.

Horsman, at first, failed to heed the gesticulating figure, but later, persuaded by Mr. Norton, rapidly applied his brakes, and, followed by the eager crowd, was provided with fuel.

A few seconds, and he was off again. The tune of his exhaust note removed any doubts as to the condition of his machine. Three laps to go for the 150 miles! The

V. Horsman (Norton) filling up after breaking the one hour record. Mr. J. L. Norton will be observed busily filling up the oil tank.



A duel between O. de Lissa (Motosacoche) and R. E. Dicker (Norton).

diminutive figure, almost horizontally poised on the banking, suddenly crawled down and stopped! The thought of failure when so near the goal aroused much sympathy for the plucky rider, and a sidecar outfit was at once despatched to his rescue. Off again, but many minutes passed before he hove in sight, and when he appeared he was wobbling dangerously from side to side with a flat rear tyre. Nearing the group of admirers, he signalled his determination to carry on, and, escorted by two sidecar outfits, he finished at the railway straight, Col. Lloyd observing from the timekeepers' box.

One fall during the last memorable laps caused a wound on the head, and on his return he was greeted with cheers from the anxious crowd, provided with stimulant, and "chaired" to the sidecar, which carried him back to the paddock the holder of a series of magnificent records.

Official results subject to confirmation.

CLASS C.—MOTOR CYCLES NOT EXCEEDING 500 C.C.

50 miles	41m. 45⅘s.	= 71.84 m.p.h.
100 miles	1h. 26m. 52⅕s.	= 69.07 ,,
150 miles	2h. 17m. 28⅘s.	= 65.47 ,,
1 hour	71mls. 1,173yds.	= 71.68 ,,
2 hours	138mls. 1,258yds.	= 69.36 ,,

A hot sun shone down on the seven starters for the first race, the All Comers Solo Handicap, and a fine day at Brooklands proved a pleasant change.

This race, in which a distance of three laps had to be covered, was marred by several bad starts. The first man off (F. A. Simpson), Metro-Tylor, led for the first lap, followed by E. Longman, J. F. Hull, and F. A. McNab (2¾ Wooler), whilst the scratch men were signalled to start as the sixth man crossed the starting line on his second lap.

E. Longden, on a Dot-Jap, took the lead in the second lap, and kept his place, winning easily ahead of E. Longman (Wooler), while V. E. Horsman (Norton) followed, pursued by F. J. Hull Wooler. Results:

	Handicap. m.	s.
1. E. Longden (Dot-Jap 61×60, 350 c.c.) ..	3	15
2. E. Longman (2¾ Wooler 60⅝×60, 346 c.c.)	3	39
3. V. E. Horsman (Norton 79×100, 490 c.c.)		36

Winner's speed, 56.55 m.p.h.

The 2.30 p.m. race, a handicap for three-wheelers attracted fourteen starters, and the use of the clutch in preference to a standing start made an appreciable difference to the "get away."

H. J. Rowe (4 Triumph sc.) led in the first lap, followed by the winner of the previous race, this time seated in a Morgan, whilst Crossthwaite (James sc.), J. Chater-Lea (Chater-Lea sc.), and R. E. Ricker (Norton) followed. Chater-Lea was going well, and creeping up to Eric Longden (Morgan) who overhauled him in the last lap. O. de Lissa (Motosacoche sc.) came in third, followed by R. E. Dicker (Norton sc.). Results:

	Speed.
1. J. Chater Lea (Chater Lea sc. 86½×85, 999 c.c.)	57.14
2. Eric Longden (Morgan 90×77½, 998 c.c.) ..	—
3. O. de Lissa (Motosacoche sc. 82×94, 990 c.c.)	—

The following event, a race open to members of the Public Schools M.C.C., proved a very sporting contest, and amongst the thirteen starters we noticed a new M.A.G. engined Martin with redesigned valve gear, ridden by Capt. A. G. Miller. Many varying designs of heat distributors in the combustion heads were to be seen on these machines.

H. B. Browning (Scott) got away well, and the first lap showed H. V. Prestwich (Nut-Jap), D. Crawford (Zenith sc.), and L. P. Openshaw, on a similar machine, well to the fore.

L. P. Openshaw gradually overhauled all the other competitors, and roared in at the finish at a speed of 61.8 m.p.h. Results:

	Handicap. m.	s.
1. L. P. Openshaw (Zenith sc. 90×77½, 986 c.c.)	1	48
2. H. V. Prestwich (Nut-Jap 60×61, 380 c.c.)	1	57
3. J. P. Riddock (Zenith 70×64½, 496 c.c.) ..	1	42

Six starters only lined up for the ten miles scratch race limited to motor cycles in Class E. The competitors were started from the railway straight, and, as they passed the grandstand, O. M. Baldwin Matchless-Jap), E. Remington (Nut-Jap), and H. P. Harveyson (Indian), were well ahead of L. A. Cushman (Zenith). Remington crept up to first place, and, Harveyson following, left Baldwin in rear. In this order they finished. Remington's speed of 79.71 m.p.h. creates a new record in Class E, the old figures standing at 77.95 m.p.h. Results:

	Speed.
1. E. Remington (Nut-Jap 90×77, 998 c.c.) ..	79.71
2. H. P. Harveyson (Indian 82.5×90, 994 c.c.)	—
3. O. M. Baldwin (Matchless-Jap 90×77.5, 996 c.c.)	—

The last race for 3½ h.p. solo machines in Class C (over 380 c.c. and not exceeding 500 c.c.) was, as previously stated, marked by V. E. Horsman's remarkable performance. Eleven riders faced the starter at 4 p.m., and all got away well, with the exception of L. E. Pope (Matchless M.A.G.) and M. Latezi (Rudge).

Pope's carrier came loose in his first lap, which necessitated a temporary halt, whilst Kennedy (Rudge) was misfiring badly.

At the end of the first quarter of an hour, the laps covered by the foremost riders were as follows: V. Horsman and J. S. Patterson (Nortons), six laps; W. Edmondson (Triumph) and H. P. Harveyson (Indian), five laps. Of these, Harveyson retired.

The field now ran as follows: V. Horsman (well ahead), J. S. Patterson, L. E. Pope, and Tudor Thompson (Douglas). These places remained unchanged to the finish, showing an easy victory for V. Horsman, who won by twenty-one miles. Results:

	Distance. mls.	yds.	Speed. m.p.h.
1. V. Horsman (Norton 79.5×100, 498 c.c.)	71	1,173	71.68
2. J. S. Patterson (Norton 79×100, 490 c.c.)	50	496	50.23
3. L. E. Pope (Matchless-M.A.G. 64×77, 496 c.c.).....	46	353	46.20

Coventry and Warwickshire M.C. Hill-climb.

A Three-cornered Contest.

STILE KOP was again the scene of a hill-climbing contest on Saturday last, the Coventry and Warwickshire Club holding an event for members. Exceptional interest was taken in the event, hundreds of spectators lining the hill sides. The series of events enabled a mere handful of competitors to show up conspicuously, and this group secured runaway wins. The two most notable performers were H. W. Hassal (on a 3½ Norton) and T. C. Greenwood (on a 4 Sunbeam). These two riders showed magnificent judgment, and each time got off the mark in splendid style, and flashed over the finishing tape at mile-a-minute speeds. On their first solo climbs, each rider clocked 31s. for the course of five-eighths of a mile, and, as a cup was offered for the fastest time of the day, it was necessary that they should run off the tie. Besides the two named, T. C. de la Hay (3½ Sunbeam), whose time had been recorded as 41s. (although his speed at the top, to all appearances, was certainly equal to the other competitors), at his own request was granted another run. This three-cornered contest, sandwiched between the car events, proved the tit-bit of the day. On the second ascent, Greenwood improved upon his previous time by ⅗s., whilst Hassal duplicated his previous time. De la Hay was 3s. slower than Hassal, and was undoubtedly slowed by a slight speed wobble. Thus Greenwood was left the winner of the cup. It may be remarked that both Greenwood and Hassal are youngsters whose fathers are prominently engaged in the motor cycle industry, and were actually present at the event on Saturday to see their sons perform so well. Provisional results:

Considerably over a thousand spectators viewed the hill-climb of members of the Coventry and Warwickshire M.C. at Stile Kop last Saturday. Some good riding was witnessed and fast times recorded.

FASTEST TIME OF DAY (Amateur and Lightweight): T. C. Greenwood (Sunbeam).
FASTEST SIDECAR: H. W. Hassal (3½ Norton), 44s.
CLASS 1: J. E. Chamberlain (2¼ Morris), 1m. 9s.
CLASS 2: T. C. Greenwood (2¾ Sunbeam), 48s.
CLASS 3: S. R. Philpot (2¾ Douglas), 1m. 6s.
CLASS 4: C. E. Starling (3½ Norton), 39⅕s.; W. Worral (3½ Sunbeam), 40⅗s.
CLASS 5: H. W. Hassal (3½ Norton), 31s.; W. Worral (3½ T.C.D.-J.A.P.), 39s.
CLASS 6: T. C. Greenwood (4 Sunbeam), 31s.; L. Crisp (4½ Humber), 42⅗s.
CLASS 7: H. W. Smith (7-9 Indian), 41⅗s.
CLASS 9: T. C. Greenwood (4 Sunbeam), 59s.
CLASS 10: H. W. Hassal (3½ Norton), 44s.
CLASS 11: W. F. Davenport (8 A.V.), 51⅗s.
CLASS 12: J. P. Black (9.76 Hillman), 63⅗s.
CLASS 13: C. Bedford (9.76 Hillman), 44s.
CLASS 14: W. F. Davenport (8 A.V.), 48s.

T. C. Greenwood (Sunbeam), who made fastest time of the day. He is the son of the designer of the Sunbeam.

LIVERPOOL MOTOR CLUB.

THE 'open Reliance Cup Trial' which takes place next Saturday has received a large and representative entry, both from private and trade riders. The start will be at 9.30 am. from the Hawarden Castle Hotel, Queensferry. The Reliance Open Challenge Cup and the Reliance Amateur Challenge Cup are the principal awards, but there are three other trophies confined to members, including one for ex-D.R.'s. A hill-climb on the formula $\frac{C \times T^2}{W}$ is included, but will only be used to decide a tie for the first place or any of the special awards.

H. W. Hassal, jun. (Norton), and his father. He tied with T. C. Greenwood for fastest time of the day, the latter lowering his time, however, on the re-run.

RACING THROUGH A SANDSTORM.

Trying Weather Conditions reduce Speeds in the Scottish Championship Meeting at St. Andrews.

THE speed championships decided on the sands at St. Andrews might be termed the blue riband of Scottish motor cycle racing, and this year the meeting proved to be one of the most successful events yet held, both as regards the entries and the various other features which go to constitute the successful speed trial. There was but one factor which detracted from the complete success of the day, namely, the wind, which on September 4th surpassed itself in vigour and continuity even for Scotland. Both riders and onlookers were subject during the day to a merciless sandblast, and in the official inner circle it was noticeable that the wisest of the officials had equipped themselves with goggles. A great many of the competitors rode without such protection, and consequently suffered considerably with their eyes. The weather conditions, therefore, prohibited the establishment of very fast times, but on the whole the performances were good.

There were twelve classes, in which no fewer than 194 entrants competed. Results :

CLASS 1. Scottish lightweight speed championship. Not exceeding 350 c.c. Ten laps, approximate distance twenty miles. Fourteen entrants: 1, A. Alexander (2¾ Douglas); 2, H. Mason (2¾ N.U.T.). Alexander took this event by storm, winning by at least one and a half laps. This was really a remarkable performance. Mason rode exceedingly well, but obviously his machine had not the turn of speed which decided Alexander as a winner.

CLASS 2. Scottish mediumweight. Engines exceeding 350 c.c. and not exceeding 550 c.c. Distance, twenty miles. Thirty entrants: 1, A. Alexander (2¾ Douglas); 2, P. S. Milner (3½ Sunbeam). In this event A. Alexander again swept the board, winning by nearly two laps.

CLASS 3. Engines exceeding 560 c.c. and not exceeding 1,000 c.c. Distance, twenty miles. Thirteen entrants: 1, G. Grinton (7-9 Harley-Davidson); 2, A. Alexander (7-9 Indian). This was the first really exciting run of the day, as during the first five laps G. Grinton and H. Fairley, riding Harley-Davidson and American Excelsior respectively, ran neck and neck, and were constantly passing and repassing each other. At the end of the fifth lap Grinton obtained a slight lead, and on the very last lap of all Fairley, who was holding Grinton with apparent ease, had the misfortune to crash at the last corner of the race. This mishap caused him to lose at least a minute, but it would be unfair to suggest that had not misfortune befallen him Fairley would have won, as Grinton rode with splendid dash and good judgment.

CLASS 4. Private owners. Engines not exceeding 350 c.c. Distance, six miles. Nine entrants: 1, J. Beveridge (2¾ Douglas); 2, R. D. Somerville (2¾ Douglas).

CLASS 5. Private owners. Engines exceeding 350 c.c. and not exceeding 560 c.c. Distance, six miles. Seventeen entrants: 1, J. W. Walker (3½ Norton); 2, E. Napier White (3½ Edmund-Moser). Walker won by a slight lead, White continuing to press him till the finishing line was crossed.

CLASS 6. Private owners. Engines exceeding 560 c.c. and not exceeding 1,000 c.c. Distance, six miles. Eight entrants: 1, B. G. Valentine (7-9 American Excelsior); 2, G. R. Arnot (7-9 Harley-Davidson). This race was not so hotly contested as some of its predecessors, and the long row of spectators that lined the outer ropes appeared to derive a good deal more excitement from witnessing an unfortunate spectator pursue his hat, which blew off and proceeded across the sands towards the sea at terrific speed. It was a very close finish as to whether the spectator caught the hat or the hat reached the sea. The spectator won.

CLASS 7. Engines not exceeding 350 c.c. Distance, six miles: 1, D. Alexander (2¼ Royal Enfield); 2, J. M. Russell (2¼ Levis). Russell's machine was not in very healthy tune, and during the race his engine began to misfire, and refused to fire evenly for half a mile or so.

CLASS 8. Open. Engines not exceeding 350 c.c. Distance, two miles: This event was run off in two heats. 1, A. H. Alexander (2¾ Douglas); 2, H. Mason (2¾ N.U.T.).

CLASS 9. Open. Engines exceeding 350 c.c. and not exceeding 560 c.c. Distance, two miles: 1, A. H. Alexander (2¾ Douglas); 2, A. B. Fairley (3 A.B.C.). There were four heats, during which Milne, who had ridden well hitherto, had the misfortune to break his clutch after running second in his heat.

CLASS 10. Engines exceeding 560 c.c. and not exceeding 1,000 c.c. Distance, two miles: 1, F. W. Dixon (7-9 Harley-Davidson); 2, G. Grinton (7-9 Harley-Davidson).

CLASS 11. Inter-club team race, confined to clubs affiliated to the Scottish A.C.U. Distance, ten miles: So far as public interest was concerned, this was undoubtedly the most closely followed race of the day, though, unfortunately, one or two of the club teams, including the Glasgow Western M.C.C., did not materialise. The event was, at any rate, exceptional in the feature that all the competitors got well off the mark. A. Alexander, from some obscure reason, fell out during the race. At the end of the first lap, G. Grinton, who rode in the Edinburgh team, obtained a good start, and Edinburgh won the race with only two competitors finishing. G. Grinton (Harley-Davidson), A. Alexander (3½ Douglas), and H. E. Fairley (A.B.C.) composed the team.

CLASS 12. Open. One mile sidecar race. Engines not exceeding 600 c.c.: 1, J. W. Walker (3½ Norton sc.); 2, T. J. Wright (3½ Indian Scout sc.). Interest was now beginning to flag, owing to the increased fury of the sandstorm, and the last event was run amidst the dispersing of the crowd.

CLASS 13. One mile sidecar race. Engines exceeding 600 c.c. and not exceeding 1,000 c.c.: 1, F. W. Dixon (7-9 Harley-Davidson sc.); 2, G. Grinton (7-9 Harley-Davidson sc.).

CLUB NEWS.

Northern M.C.

The winner of the Rudge-Whitworth cup in the 250 miles reliability trial is Mr. A. Stothard (2¾ Diamond). Mr. O. L. Rutter (8 G.N. cycle car) and Mr. J. Orde (3½ N.U.T.) respectively take second and third prizes.

N.M.C.F.U. (Leeds and District).

The results of the reliability trial of 164 miles are now to hand. The winner receives a gold medal and holds the Great North trophy for one year. 1, A. Bannister, jun. (3½ Invicta sc.); 2, J. H. Calvert (7-9 Indian sc.); 3, E. Preston (7-9 Harley-Davidson sc.).

Bedford and District M.C.

At a recent general meeting of the Bedford and District Motor Cycle and Light Car Club, it was decided to abbreviate the title to the Bedford and District Motor Club. A successful twenty-four hour reliability trial was held at the end of last month, and thirty riders of solo machines, sidecars, and cars competed in the run to York and back. Only three failed to complete the double journey, the results being as follow: Sanders Cup (for cars).—J. Cocker (10 Crouch). Allen Cup (sidecars).—A. Collins (6 Martinsyde sc.). Humphries Cup (solo).—J. Knight (3 A.B.C.). The team prize was won by H. Hartrop (7-9 Harley sc.), W. Holland (6 A.J.S.), and G. D. Johnson (8 Zenith sc.).

Berwick and District M.C.

The following are the results of a hill-climb held on September 5th: Class 1 (350 c.c.).—A. Paton (2¾ Verus-Blackburne). Class 2 (500 c.c.).—C. F. Brown (4 Triumph). Class 3 (1,000 c.c.).—W. Murray (3½ Sunbeam). Class 4 (unlimited).—G. Watson (8 Bat-Jap). Best time of the day: W. Murray (3½ Sunbeam).

Norwich and District M.C.

The results of this club's recent hill-climb at Ringland are as follow:

560 c.c. CLASS.—H. F. Mase (3 A.B.C.), 17s. (Mr. Howe's cup).
350 c.c. CLASS.—W. G. Barnes (2¾ Wooler), 30s. (the Secretary's cup).
750 c.c. CLASS.—H. F. Mase (3 A.B.C.), 18s. gold medal).
UNLIMITED SIDECARS.—H. F. Mase (7-9 Harley-Davidson), 25⅘s.
SCOOTERS.—O. K. Utting (Skootamota), 49⅘s.
SLOW RACE.—H. F. Mase (3 A.B.C.).

Just off. A Harley-Davidson rider starting in the recent Keighley M.C. Reliability Trial.

lub News.—

North London M.C.C.

Ladies and gentlemen joining the club after September 1st will be entitled to full membership throughout next season without payment of an additional subscription. It is hoped that this concession will induce many to join forthwith and thus participate in the last three events of this season. Full particulars are obtainable from Lieut. Alan W. Day, "Lynton," Park Crescent, Finchley, N.3.

Stockport M.C.

A reliability trial was held in the last week-end of August under perfect weather conditions, and supported by a large entry. Results: 1, Solo Club Medal and Talbot Cup, H. J. Scale; 2, Solo Club Silver Medal, A. Waterhouse and D. Vine (tie). Special prize for best lightweight performance, W. Bryans. 1, Sidecar Club Gold Medal, T. Davies. Special prize, Miss Cowley.

Public Schools M.C.C.

The reliability brake and acceleration trial of September 4th resulted as follows: 1, C. S. Burney (3½ Blackburne); 2, H. B. Browing (3¾ Scott); 3, P. Davey (3½ Norton). Class winners were: 350 c.c., A. A. ——— (2¾ Diamond); 500 c.c., C. S. Burney (3½ Blackburne); 600 c.c., H. B. Browning (3¾ Scott); 750 c.c., L. T. Gibson (5 Zenith); 1,000 c.c., P. S. Malone (7 Harley-Davidson).

Cardiff M.C.C.

Great local interest was shown in the hill-climb at Rhubina on September 4th. Results on time:

350 c.c. solo—1, R. Morel and A. Sgonina (tie, 49⅘s.); 2, E. G. Lawson (54s.). 500 c.c. solo—1, C. Sgonina (41s.); 2, F. J. Boshier-Jone (43s.). 750 c.c. solo—1, C. Sgonina (40⅘s.); 2, R. E. Toms (41⅘s.). Unlimited solo—1, B. E. Toms (39⅘s.); 2, C. Sgonina (42s.); 3, Reg. Brown and Jack Thomas (tie, 43s.). 750 c.c. sidecars—1, Reg. Brown (51s.); 2, Handel Davies (52⅘s.). 1,000 c.c. sidecars—1, A. Cook (47s.); 2, A. Thom (49⅘s.). Unlimited passenger machines—1, Reg. Brown (49⅘s.); 2, Handel Davies (50s.). Miss M. Burrell made fastest time in the Ladies' Class; the A. B. Wade Cup went to R. E. Toms; the *Evening Express* Cup to A. Cook; and the Cardiff Garages Cup to C. Sgonina.

Surbiton and District M.C.C.

Redland Hill, near the famous Leith Hill, Dorking, was, on Saturday, September 4th, the scene of a very successful and well-attended hill-climb organised by the above club. Considering the nature of the climb the times and speeds, as follow, are excellent:

CLASS A (350 c.c., solo).—1, D. S. Powell (2½ Metro-Tyler), 1m. 6⅘s.; 2, F. E. Salter (2¾ Zenith), 1m. 11⅘s.; 3, L. S. Pinder (2¼ Triumph), 1m. 27⅘s.. Winner's speed, 30.8 m.p.h.

CLASS B, provisional results (500 c.c., solo).—1, Kaye Don (3 A.B.C.), 36⅘s.; 2, Maurice C. Breese (3½ B.S.A.), 40⅘s.; 3, Reg. A. Green (3 A.B.C.), 41⅘s. Winner's speed, 55.88 m.p.h.

Class C (750 c.c., solo).—1, René Dequin (6 Zenith), 38⅘s.; 2, W. R. Hobbs (6 Zenith), 40⅘s.; 3, Geo. E. Payne (3½ Norton), 42⅘s. Winner's speed, 53.26 m.p.h.

CLASS D (1,000 c.c., solo).—Results not confirmed owing to a time query.

CLASS E (750 c.c., sidecar).—1, D. H. Davidson (4 Harley-Davidson sc.), 47⅘s.; 2, René Dequin (6 Zenith sc.), 54⅘s.; 3, H. F. Edwards (3 A.B.C. sc.), 55⅘s. Winner's speed, 42.97 m.p.h.

CLASS F (1,000 c.c., sidecar).—1, J. A. Masters (7-9 Harley-Davidson sc.), 46⅘s.; 2, René Dequin (6 Zenith sc.), 48⅘s.; 3, B. Crawford (8 Zenith sc.), 55⅘s. Winner's speed, 44.08 m.p.h.

UNLIMITED SOLO CLASS.—1, V. Gayford (5 Zenith), 35⅘s.; 2, Kaye Don (3 A.B.C.), 36⅘s. Winner's speed, 57.13 m.p.h.

UNLIMITED SIDECAR CLASS.—1, F. W. Barnes (8 Zenith sc.), 39⅘s.; 2, J. A. Masters (7-9 Harley-Davidson sc.), 45⅘s. Winner's speed, 51.65 m.p.h.

Sept. 19.—Bury and District M.C. Run to Blackpool.
Sept. 19.—Loughborough and District M.C.C. Reliability Trial.
Sept. 20.—Edinburgh and District M.C. One Day Trial.

Berwick and District M.C.

The club held a reliability run to Peebles, *via* St. Mary's Loch, on August 29th. Three competitors "tied" for first place, having lost no marks. The usual course was followed and a draw made for places. Result: 1, Capt. G. F. Steven, 5-6 Hazlewood, solo; 2, Tom Lilburn, 4¼ h.p. B.S.A. and sc.; 3, Capt. J. Cumming, 7-9 h.p. Harley-Davidson, solo.

Westmorland M.C.C.

The Westmorland Motor Cycle Club held its first speed trials on the sands near Arnside. All the events were well contested, and some very good sport was witnessed. The sand was in moisty condition, and consequently several riders were thrown, tyres being completely wrenched from the rims. In no case, however, were these accidents attended with any personal injuries beyond bruises. S. A. Marks, of Preston, on an Indian, won the Milnthorpe and District trophy, which was the principal prize. The results were as follow:

Machines not exceeding 350 c.c.: 1, B. Houlding (2¾ Douglas); 2, G. C. Ion (2¾ Douglas); 3, M. Parkinson (2¾ Douglas).

Not exceeding 500 c.c.: 1, R. O. Hodgson (Norton); 2, B. Houlding (2¾ Douglas); 3, J. Whalley (3 A.B.C.).

Not exceeding 750 c.c.: 1, R. O. Hodgson (4 Norton); 2, B. Houlding (2¾ Douglas); 3, J. Whalley (3 A.B.C.).

Unlimited: 1, R. O. Hodgson (4 Norton); 2, S. A. Marks (Indian); 3, J. Whalley (3 A.B.C.).

Handicap: 1, S. A. Marks (Indian); 2, R. O. Hodgson (4 Norton); 3, J. Whalley (3 A.B.C.).

Sidecars: 1, Caldwell (4 Norton sc.); 2, F. A. Ireland (American X sc.); 3, A. J. Moffat (4 Norton sc.).

Bury and District M.C.

The Blake Cup Trial, which was run over a very sporting little course amongst the Yorkshire moors, was not as well supported as one could wish. The results were: 1, Cup winner, H. Crompton (3½ Sunbeam); 2, J. Whittaker (4 Triumph, sc.); 3, W. Ratcliffe (4 Triumph).

Basingstoke and District M.C. and L.C.C.

At the Comrades of the Great War *fête*, held on September 4th, a successful gymkhana provided much amusement to the large crowds. Prizes on the points for each event basis went to: 1, A. Osmond (4 Triumph); 2, W. Osmond (4 Triumph); 3, W. Julian (Cedos, A.B.C., and Norton).

Plymouth and District M.C.C.

The Plymouth and District M.C.C. held a hill-climb at Huccaby on Saturday last. The hill, which was used in the course of the Arbuthnot Trial last year, was in excellent condition. The gradient is not severe, but the number of hairpins mitigate against fast climbs.

The fastest time was made by J. Spooner on an A.B.C. (solo), his time being 57s.

In the sidecar class two competitors tied with 76s.: A. Ash (Enfield) and Holmes (Harley). The formula used was the well-known *Motor Cycle*.

Leeds and District M.C. Speed Trials.

Last Sunday the Leeds and District Motor Club held a series of speed trials over a flying half mile in which some good sport was witnessed. The venue selected was Penny Pot Lane, about four miles from Harrogate, where nearly a mile of straight level road with a good surface is available.

There were about forty entries in the various classes, and the fine weather brought out a goodly number of spectators. Considerable delay was caused, however, by numerous vehicles claiming a right of way, and also by spectators straying over the course and obstructing the timekeeper's view of the signalling flags.

The speeds were quite good for a closed event in which no very special machines were entered, the most spectacular performance being that of Cawthorne (Autoglider), who sang down the course in 35⅖s. like a miniature aeroplane, and would have done even better if he had not been troubled with intermittent missing. A mishap occurred to Parr (7-9 Rudge), who started riding with play in his front forks, with the result that he developed a wobble at speed, and crashed. R. Brown, the able assistant trials secretary, rushed up the course on his Indian and administered first aid in a very capable manner.

The fastest time of the day was made by Thornton (6 Ariel), and Backhouse (4 Triumph) put up the next best performance in the solo class. In the sidecar class R. Brown (7-9 Indian) was easily the fastest. Results:

600 c.c. SIDECAR.—1, W. Backhouse (4 Triumph), 36⅘s.; 2, B. Mitchell (3½ Norton), 36⅘s.; 3, L. Chappell (4 Triumph), 38⅘s.

1,000 c.c. SIDECAR.—1, R. Brown (7-9 Indian), 32⅘s.; 2, O. Brooks (11 J.A.P.), 34⅘s.; 3, C. Thornton (6 Ariel), 35s.

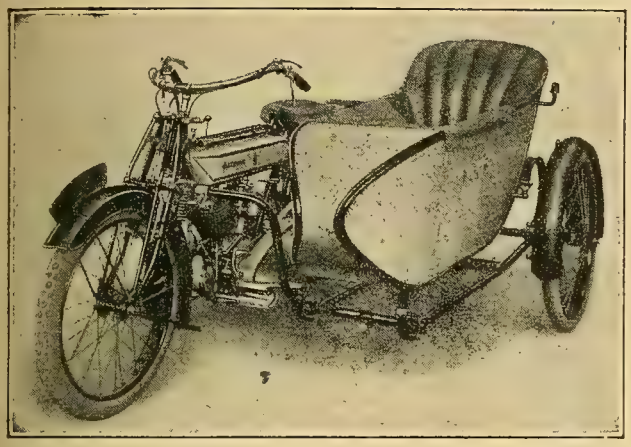
300 c.c. SOLO.—1, R. Cawthorne (Autoglider), 37⅘s.; 2, E. Smith (New Imperial), 52⅘s.

400 c.c. SOLO.—1, R. Cawthorne (Autoglider), 40⅘s.; 2, E. Smith (New Imperial), 52⅘s.

600 c.c. SOLO.—1, W. Backhouse (4 Triumph), 29⅘s.; 2, L. Chappell (4 Triumph), 29⅘s.; 3, B. Mitchell (3½ Norton), 30s.

1,000 c.c. SOLO.—1, C. Thornton (6 Ariel), 28⅘s. (fastest time of day); 2, W. Backhouse (4 Triumph), 31s.; 3, Almond (4 Triumph) and Waterman (6 Zenith), 31⅘s. (tie).

CARS (HANDICAP).—1, H. Stanhope (8 Stanhope), 33⅘s.; 2, P. Cockroft (8 Morgan), 39⅘s. (received 5s.).



The Combination with an unrivalled reputation

EVER since the 5-6 h.p. J.A.P. Hazlewood Combination made its debut, it has met with unequalled success, earning the popularity and goodwill of the motor cycling world.

It is a Combination that has completely fulfilled the requirements of the sidecar driver, every detail of design and construction being of the highest order, combining efficiency and comfort with lasting service.

The past record of the "Big H" Combination proves its marked superiority.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words 3/–, and 3d. for every additional word. Paragraphs of under 8 words are charged double rate. Each paragraph is charged separately. Name and address must be counted. Series discounts, conditions, and special terms to regular trade advertisers will be quoted on application.

Postal Orders and Cheques sent in payment for advertisements should be made payable & Co. to ILIFFE & SONS Ltd., and crossed Treasury Notes, being untraceable if lost in transit, should not be sent as remittances.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," 20, Tudor Street, London, E.C.4, or 19, Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle"—Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge, which must include the words Box 000, c/o "The Motor Cycle." Only the number will appear in the advertisement. All replies should be addressed No. 000, c/o "Motor Cycle," 20, Tudor Street, E.C.4. *Replies to Box Number advertisements containing remittances should be sent by registered post, but in all such cases it is advisable to make use of the Deposit System.*

In the case of motor cycles offered for sale under a box number, as it is unusual for these to be sold without first being inspected by the intending purchaser, advertisers will facilitate business by embodying in their advertisements some mention of the district in which the machine offered may be seen and tried.

☞ DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but, if not, we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions up to £10, a deposit fee of 1/- is charged; on transactions over £10 and under £50, the fee is 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6; and on all transactions over £100, ½ %. All deposit matters are dealt with at 20, Tudor Street, London, E.C.4, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

A.B.C., 1920.—The Layton Garages have the most interesting A.B.C. stock in England. New machines are always on hand, and the used examples that are available present opportunities that are unequalled. For instance, at £127/10 one can get a machine that, though not new, is so nearly so that the difference is scarcely discernible, and there are many others—one with a very full equipment and as new at £140, another at £135. Many men lose money through not coming to Bicester, but those that do come, and they are many, seldom go away other than surprised and very happy. It will pay you to think this over.—The Layton Garages, London Rd., Bicester, and at 90, High St., Oxford. T.A.: Integrity, Bicester. 'Phone: 35 Bicester. [X1391

Abingdon.

The "IVY" TWO STROKE

TRADE MARK

Does a 2-stroke over 250 c.c. overheat?

NOT IF IT IS AN

IVY.

A.C.U. Officially Observed Trial, July 15th, 1920.

25

Consecutive Ascents (non-stop) of the Old Wyche Cutting at Malvern.

A

3 h.p. IVY 2-stroke

350 c.c.

Successfully carried out the above exceptionally severe test under the auspices of the A.C.U. The Old Wyche Cutting is one of the steepest hills in Great Britain, the gradient at the top being 2·8. The machine ran with wonderful consistency and completed the 25 ascents at an average speed of 18·75 m.p.h. The total distance was 40 miles and the time occupied just over 2 hours. The engine of this machine is our standard production for 1921.

YOU CAN STICK

a pair of Ustikon Soles to your shoes as easy as you can stick a stamp on your letters. No tools are required, neither screws nor rivets. The method is simplicity itself. What can be easier?

Surely in these days of high prices Ustikon Soles are worth consideration. You save money on every shoe so repaired, and get double the wear at half the cost. Once you have fitted you will readily appreciate the economy.

1920 4h.p. Triumph, Model H; list price £127/10.—R. Bamber and Co., Ltd., 2, Eastbank St., Southport. Tel.: 607. [8884

TRIUMPH 1920 4h.p. Model H, as received from makers, not registered; offers.—Willis, Bapsey, Taplow, Bucks. (D) [8700

TRIUMPH, countershaft, 3-speed, etc., lamps, horn; 70 gns., lightweight part.—Newnham, 223, Hammersmith Rd., W.6. [8619

LATE Countershaft Triumph Combination, everything as new, fully equipped; £115.—20, Valnay St., Tooting, S.W. [8591

TRIUMPH (Baby), brand new, never ridden; £70 lowest, no offers.—Oliver, Cambridge Place, Burrage Rd., S.E.18. [8182

1913 Clutch Triumph and Featherweight Sidecar, lamps, horn, and tools; any trial; £48.—322, Rice Lane, Liverpool. [8828

TRIUMPH 1920 Motor Cycles at makers' prices, all models, immediate delivery.—Wilkins, Simpson opposite Olympia, London. [8047

T.T. Triumph 3½h.p., clutch model, Bosch, splendid condition, tyres, etc., nearly new; £42, offers.—65 Church Rd., Hendon, N.W. [8468

THE MOTOR CYCLE
ESTABLISHED IN 1903
AND FOR OVER SIX YEARS THE ONLY PAPER SOLELY DEVOTED TO THE PASTIME

Advertising and Publishing Offices: 20, Tudor St., London, E.C.4. *Editorial Offices:* Hertford St., Coventry.
Telegrams: "Cyclist, Fleet, London" *Telephone:* 2818 City (11 lines). *Telegrams:* "Motocycle, Coventry," *Telephone:* 10 Coventry (5 lines).

Lower Prices Not in Sight.

MISCHIEVOUS rumours are afloat at the present time. These rumours, which concern the financial position of the motor and motor cycle trade, are generally spread and started by irresponsible and ill-informed persons, and are calculated to do considerable harm to a large and growing industry. It becomes necessary that some kind of denial should be published.

It is true that certain firms have gone into liquidation, some only for the purpose of reconstruction. It is true also that the artificial conditions prevailing immediately after the Armistice no longer exist, and consequently a certain number of insecure and "mushroom" firms are bound to be hit. This was only to be expected on the return of more normal conditions, as any clear-sighted business man could see for himself.

Premiums are no longer demanded or paid, but there is still a steady demand for motor cycles, both at home and abroad. Undoubtedly the public are becoming more discriminating, with the consequence that the weaklings must suffer and the fittest will survive. In the end this will be good for both the industry and the rider provided that sound mechanical innovations are not knocked out for reasons connected with finance.

The rising cost of labour and material is beginning to cause the obvious reaction, and the public will no longer pay top prices for anything but the best. In spite of this there is no occasion for deliberate exaggeration.

Only last week we considered it necessary to touch upon this subject, and our recapitulation of the general position is in the nature of a warning to our readers not to acquire a distorted vision of the true facts. Those who may as a result of the rumours expect a fall in prices of new machines of the best make will unquestionably be disappointed; the cost of labour to-day simply will not permit of any decided reduction of prices.

Prospects in 1921.

THERE are symptoms of a very welcome tendency towards specialisation in the motor cycle industry. Riders of medium powered solo machines will be glad to hear that several leading firms have their requirements in mind, and the light 500 c.c. machine will once more have a prominent place on the motor cycle market.

Popular demand ensures a good market for the medium powered dual purpose mount, and this is receiving as much attention as ever at the hands of manufacturers, but the heavy sidecar outfit shows signs of developing on the lines of the permanent three-wheeler rather than as two separable units. This is as it should be, and should lead to the production of a stronger, lighter, and more comfortable machine.

The genuine lightweight is in the course of development, and thoroughly protected hoseable motor cycles are on the stocks in more than one factory of world-wide reputation. There is room for all types, and specialisation will do more to improve the breed than all the compromises of the past.

No machine can be perfect from the standpoint of both the solo rider and the sidecarist, and though there will always be a demand for a type of machine which is capable of either work, there can be no suggestion of finality in design until the true solo mount and the light economical passenger machine have received the undivided attention of their designers and manufacturers. Weight is an important factor in economy, and just as many solo machines are handicapped by being built heavy enough for sidecar work, so the weight of the passenger mount is increased by the addition of heavy and unmechanical couplings and by being tied to a design which is more or less suitable for solo purposes.

We heartily welcome these signs of specialisation, and we are led to consider that the prospects of the industry are considerably improved thereby.

An index to the advertisements in this issue will be found on the page facing the back cover.

Oilsheet for Cylinder Washers.

THE various correspondents who are excited about cylinder washers will find that a few pennyworth of oilsheet and a sharp penknife are the goods for the job. I merely entered into the fray because somebody denounced ordinary paper, which is a very handy makeshift in the absence of proper materials. Oilsheet cuts true to line, does not tear, and is proof against disintegration.

Profiteering in Plugs.

I HAVE recently received several complaints about manufacturers' charges for spares. I cannot enter into any discussion of the prices asked for parts which are actually made in the factory; nobody outside the firm's own costing staff can definitely say what figures are justifiable for such items. But the case is very different when a manufacturer buys at wholesale price an accessory made by another firm and passes it on to his customers at retail price, plus a large surcharge. Here is a particularly noxious example taken from a receipted invoice sent to me by a reader.

	£	s.	d.
Two X—— sparking plugs, 7s. 6d. ...	0	15	0
Plus 20%	0	3	0
	0	18	0

This is incredibly stupid and wicked. The transaction shows a profit to the motor cycle manufacturer of nearly 100%, and is calculated to disgust all his customers. If his engine is only suited by a special seven-and-sixpenny plug, it is high time he redesigned it to use ordinary plugs, whilst words fail me as to the iniquity of that unblushing "+20%," considering that he has previously taken a profit of perhaps 2s. 6d. on brief handling a 7s. 6d. article weighing about 4 oz. and demanding a mere three inches of store room.

Motor Cyclists or Chamois?

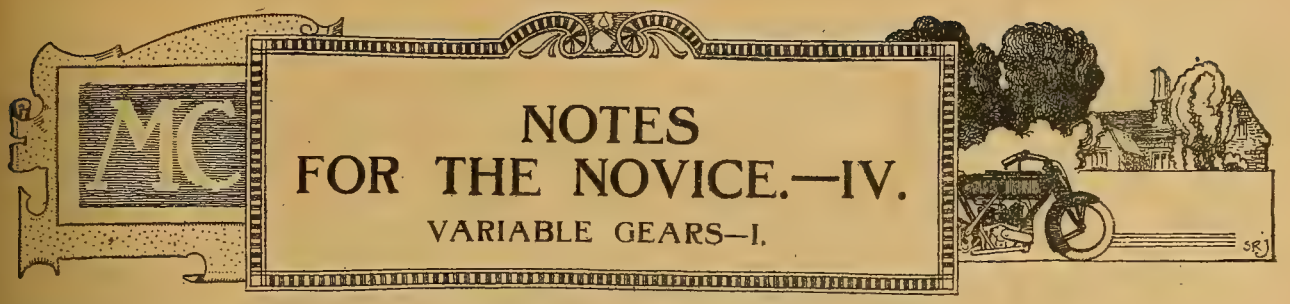
I LIKE H. M. Batten's epigram that only an antelope in its prime could hope to cover an A.C.U. course gracefully. What betrays most of us into making asses of ourselves on freak hills is sheer want of practice. The experts who say you *must* keep your feet on the rests are quite right. But when you have not struck anything rougher than Sunrising for the last twelve months, the mere sight of a climb like Park Rash puts the wind up you. Then you mismanage your throttle. Possibly you think you won't have much in hand; you bang over your throttle; your back wheel begins to caracole like an aeroplane on a bumpy morning; and out go your feet from sheer terror. Alternatively, you decide to be very slow and cautious like the Blackpool express at wakes time. The speed isn't high enough for good steering way, and out go your feet for quite a different reason.

Bravo the Little 'Uns.

WE shall have to revise our judgment of the baby motor cycles, when eighteen machines under 350 c.c. can finish such a test as the 1920 Six Days, fifteen of them earning their golds, and eight of those fifteen coming inside the 275 c.c. limit. Above all, the Velocette trio seriously threatened to rob all the big fellows of the trade team prize, and, in spite of the frightful hills, finished no more than twenty-three marks behind the incomparable Scott, and seven marks astern of the trusty Triumphs. Of course, it by no means follows that these placings represent the comparative appeals which divers types of touring 'bus make to the average buyer.

Local Service.

NOT long ago a single issue of this paper chanced to contain two letters from riders resident at considerable distances from the factory towns, each of whom had paid some £3 in railway freights, quite apart from the expense of repairs and temporary deprivation of his machine. Railway charges are now so high that this aspect of the matter has become serious. Moreover, an uncrated machine seldom arrives undamaged. I have twice sent machines by rail this year. One of them arrived with a dented tank and a broken stand; the other with its lamps out of commission and its kick-starter useless. Such mishaps may easily imply a fresh visit to the factory, whilst a private individual is never sure of success in his claims against a big corporation. I know one or two firms who have not yet begun to dream of *local* service. Businesslike organisation *at the factory* is as far as they have got. But as soon as a concern has, say, 1,000 customers in a single county, it becomes worth its while to organise a depot in that county.



NOTES FOR THE NOVICE.—IV.

VARIABLE GEARS—I.

THE first word of advice that I should like to give to the young rider respecting his gear box is that he should make full use of it. We hear much about one machine or another being able to climb a certain hill on "top." If the hill in question is really a steep hill and the machine is provided with a three or four speed gear this simply means that the top gear is unnecessarily low, and speed under more favourable circumstances must be sacrificed. Ten pounds or so of extra weight would not be added to a machine just for fun. If a fast climb is required this can, more likely than not, be attained on a lower gear. Climbing "on top" has no particular merit. What is wanted is that a machine should be able to climb any hill without the engine labouring, and fast or slowly, as required, and this is the aim and object of fitting a gear box. Whether he is out for speed or pleasure the novice will be well advised not to hang on to top gear too long. These remarks apply more particularly to those motor cycles which are fitted with three speeds.

When a machine has but two gears, especially when the lower gear has twice the ratio of the higher, *e.g.*, 6 and 12 to 1, it is desirable that more climbing should be done "on top," which should in consequence be a little lower than when more ratios are provided. It is understood that the first speed is the lowest, and so on, the third or fourth being the top, according to whether three or four speeds are provided. Nearly all single speed machines, if not all at present on the market, are driven by a belt; it is therefore possible and desirable that an adjustable pulley should be fitted. The gear can then be lowered for use in hilly country, and this will be found to be a great advantage.

The Position of the Gear Box.

There are three positions in which it is possible to place the gear box: (1) on the engine shaft or an extension of it, (2) on the countershaft, and (3) in the hub. Beyond this some variable belt drives are operated at more than one place—for instance, on the engine shaft and at the rear wheel at the same time.

The advantage of a gear on the engine shaft is that as it runs at high speed the parts can be made lighter than when a reduction in speed takes place before the gear is reached. The disadvantage is that, in the usual motor cycle layout, it means much overhanging weight and wear on the engine bearings as well as an awkward appearance. Moreover, it is difficult to interpose a clutch between the engine and an engine shaft gear on a motor cycle.

I know of no advantage possessed by the hub gear except that when used with belt drive it enables the belt speed to be maintained when a change down is made, and therefore by dropping the road speed strain can be taken off the belt and belt slip prevented to a large extent in wet and snowy weather. It is therefore not surprising that the hub gear is no longer made, for it did not prove altogether reliable, though it often gave good service in careful hands; it was not oil-retaining and it required constant attention, and frequent lubrication with the oil recommended by the makers; an unsuitable oil caused clutch slip and possibly other troubles.

By a process of elimination we find that the countershaft position has become almost universal in motor cycle practice with a reduction in gear carried out through the transmission both between the engine and gear box and between the latter and the rear wheel. Thus when running on top gear the engine is turning over at from two to three times the speed of the gear-shaft, which must therefore be capable of withstanding a torque from two to three times greater than that produced by the engine at the moment of its greatest thrust, and thus will depend rather upon the capacity of a single cylinder than upon the whole cubic capacity of the engine. For instance an 8 h.p. twin will not need a heavier gear box than a 4 h.p. single, the capacity of which equals that of one cylinder of the twin, provided that the ratios from the engine to the gear box are equal in each case: for the impulses will be approximately equal in themselves, though in the twin-cylinder engine they will be repeated with greater frequency and thus produce a greater horse power.

Types of Gear Box.

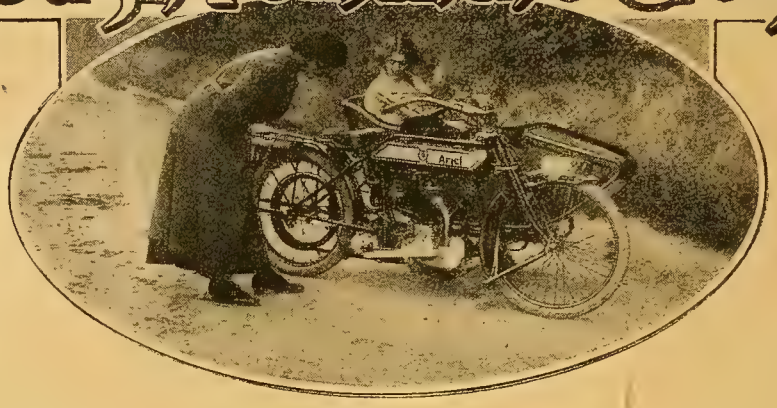
Over and above the number of the gears there are several different types of gear box. Most of the gears at present in use are of the sliding type which drive from a main shaft to a lay shaft and back again. In some the gears themselves slide in and out of mesh, in others the gears are always in mesh, and the required pinions are engaged to the shaft by means of sliding dog clutches. When the gear pinions are always in mesh the teeth are less likely to be damaged by careless gear changing, but on the other hand there must be a certain amount of added friction when several pairs of pinions are running idly in mesh, though not much, as well as some additional noise. Moreover, as the number of gears increases, so also does the difficulty of keeping all the pinions in mesh without taking from the simplicity of the gear box. Thus it is usual to find a two-speed gear box with its gears always in mesh, while a three-speed gear often has its low gear in constant mesh, and the middle gear engaged by sliding the teeth of the pinions into position, though all three pairs of pinions may be and often are in constant mesh, in which case the two middle pinions slide together and a third dog clutch is provided.

J.H.W.

(The next instalment will also deal with Variable Gears.)

Through Feminine Goggles

With a Two-stroke on the Kentish Roads.



A Tale of a Sparking Plug and the Sequel.

By Dorothy M. Comber.

"EVERYBODY according to his taste," but give me a two-stroke motor cycle.

I was one of the first girls to ride one, and the consternation caused in the little Kentish village when I was seen astride a 2¼ h.p. Levis still lives in my memory. Many, and joyous, were the week-ends spent in its company.

How I recollect Old Man Sol peeping in at my bedroom window very early on a summer's morning—the hurried breakfast in my eagerness to be on the move, and the pardonable pride with which I looked at my little two-stroke—a perfect picture, reflecting the sun's rays from a hundred glistening points—amply repaying the labour spent in polishing and general furbishment. With a slight push forward the little engine pulses into life, and we are off. This time I choose Folkestone for my objective—the road then being in splendid condition and with beautiful scenery all along.

At the early hour of 6 a.m. there are comparatively few people on the road, and one can take advantage of a good mile or two to "let her out."

An enchanting highway, this, bounded on either side by well trimmed hedges, and beyond these again fields of lush green grass, dotted here and there with cows and sheep leisurely grazing, and in the background misty purple hills, outlined against the blue sky.

An Early Morning Race.

Coming to a quaint old bridge, spanning the swiftly flowing river, the beauty of the scene compels me to stop, and as I gaze into the liquid depths, clear as crystal, I can almost count the stones and discern without effort fish darting in and out of waving weeds.

Although loth to leave such an enticing spot, the purring of a motor cycle in the distance awakens the speed demon (always more or less dormant in motorists) and soon I am whizzing along the shady road. Nothing is in sight, and the steady beat of the machine behind is gaining on me bit by bit. This will never do! I open out the throttle and give a little more air. The two-stroke seems like a bird, and for three miles I keep well ahead. Breasting a long incline I was still going strong, and arriving at the top slowed down preparatory to taking a rest.

Here the scenery was absolutely enchanting; and I felt I should like to make a record of its beauty, so taking out my pad I made a hasty pencil sketch of the little village, nestling in the hollow, which was visible through a break in the trees. Then there were the little river unrolling itself like a silver ribbon and the picturesque old church—with its spire cutting the sky like an upraised sword.

The Comradeship of the Road.

I became suddenly conscious that the throb of the other machine had changed in tone and had become intermittent, when it became clear to me that something was wrong, and in a short while the reason for this became apparent, for, glancing down the hill, I saw at once that the machine was labouring. When the rider at last arrived at the spot where I was seated—he pulled up. My new companion, without any preliminary introduction, remarked, with a somewhat sorry smile, that one of his last two remaining sparking plugs had given out, and he had managed to hobble along on one cylinder. Fortunately, I had two spares, and immediately offered him one. He demurred, and we had some little altercation as to whether he should or should not take advantage of my offer, but I finally induced him to do so, and in a very short time we were riding side by side at top speed. His machine was a three-speed Douglas, and my little Levis seemed diminutive beside it. Nevertheless, I found no difficulty in keeping pace with him, and, though at times he forged well ahead on the level, I held my own on even stiff gradients.

Mid-day saw us on the outskirts of Folkestone, after a truly joyous run of about thirty miles; and at my new comrade's suggestion we lunched together—spent about three hours by the sea and started for home about five o'clock. We had replenished both motors with oil and petrol, and cleaned and trimmed our lamps—at that time my machine was not equipped with electric lighting, but I have since found that this is no great advantage, as acetylene, in my opinion, despite its drawbacks, is much more reliable.

We started off in fine style, thoroughly invigorated by the sea air, rest, and refreshment, and made good time to Maidstone, arriving well under two hours.

Through Feminine Goggles.—

Shortly after leaving the town we came upon two fellow travellers who were evidently in difficulties. In accordance with the unwritten law of the road, which every genuine motorist instinctively observes, we pulled up to enquire the cause of the trouble. It transpired that one of their machines had, for some mysterious reason, "conked out," and neither of the riders was too well versed in the intricacies of its mechanism. They had tried many and various expedients without success.

My companion proffered his assistance, and the three men together made an exhaustive overhaul of the machine. I was sitting on the bank watching them, and the memory of a past difficulty with a carburetter coming into my mind prompted me to suggest that it might be worth while to examine the petrol strainer gauze. Acting upon the suggestion, the connecting pipe was uncoupled, and sure enough the trouble was revealed—the strainer absolutely choked with dirt from the use of second-grade petrol.

They were profoundly grateful to me for the hint, and I caught a remark passed between them in an undertone that I was a "real brick," and they were exceedingly astonished to discover that a mere girl could possibly know more about a machine than they themselves. On the strength of this incident they attached themselves to us, and I found myself with quite an imposing bodyguard. The delay caused by this little episode made us much later in getting along than I had reckoned on, and the moon was just creeping up behind a bank of dark firs.

In the Calm of the Evening.

The air was soft and balmy, still retaining the warmth of the day. The odour of the pine woods wafted across to us its invigorating breath. We heard the nightingale's sorrow-laden song, as it echoed and re-echoed amongst the trees. More than once a little furry animal, startled from its hiding place, skurried across the road, in mortal fear of the strange monsters rushing by, doubtless intent on its destruction. In due course the outposts of my village came in sight, and our two companions left us at the cross-road, as they were going on in the direction of London. My faithful knight insisted upon seeing me safely upon the threshold of my home, notwithstanding that his road lay with the other two; but in answer to my expostulation he remarked that, his being the more powerful machine, he would soon catch them up. I bade him good night and stood watching him as he mounted and rode away. As he waved a last farewell I noticed a peculiar movement of his hand, and a moment afterwards something dropped at my feet, but he was out of sight before I could stoop to see what it was.

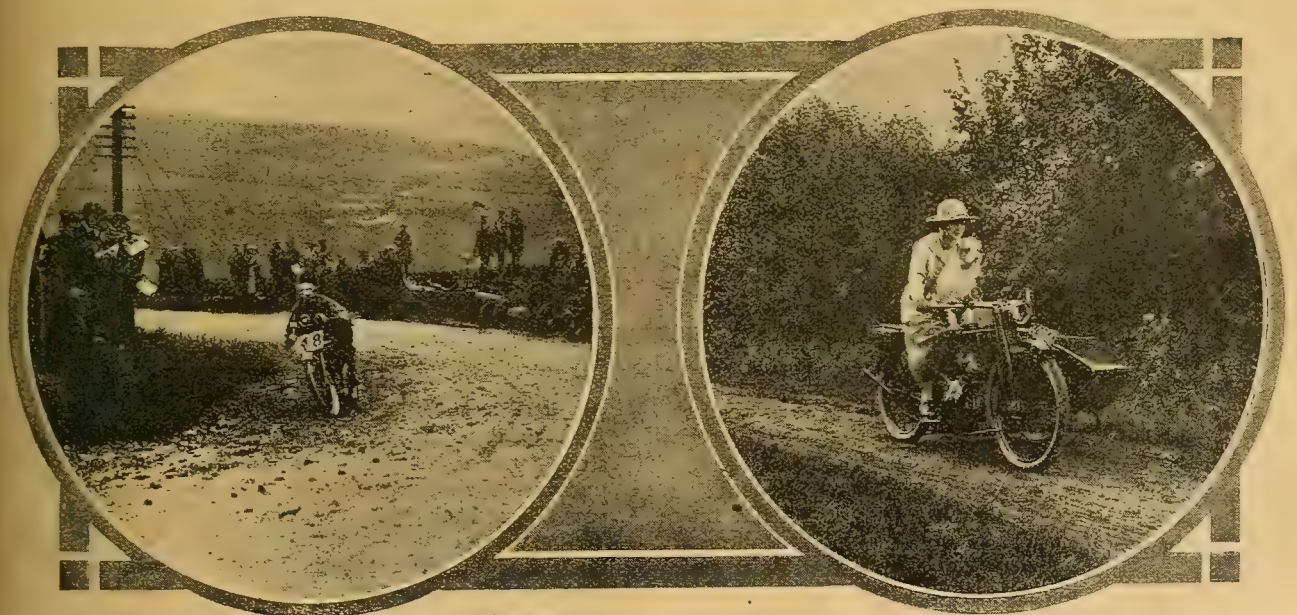
Possibilities of the Lightweight.

When I looked down I discovered a small parcel securely wrapped in brown paper, and the feel of it immediately told me that my friend of the road had repaid my loan with interest by leaving with me two Lodge plugs. I suppose he knew I should not wish to accept them, and so had prevented any argument by settling the matter in this way.

To those who are considering the advisability of riding a two-stroke, I would say nothing can be better than a simple light-weight. If kept in good trim even the worst hills can be surmounted, and a long run can be faced without fear. Many a delightful day's run and week-end adventure will be within their grasp.

I always did minor repairs myself, and do not remember being let down on a single occasion through breakdown. Of course, I have suffered from the usual mishaps such as punctures, empty oil and petrol tanks, defective sparking plugs, and so on—such things will occur—but I feel sure, as in my own case, help will be forthcoming from a fellow-traveller.

Possibly the unconventionality of my experiences may strike some readers. To my mind that is one of the chief charms of motor cycling, and I have ever received timely help and assistance from the owner of the Rolls-Royce down to the humble pedal cyclist.



Even the strenuous pastime of trials riding attracts some lady motor cyclists, who find a greater fascination in arduous hill-climbing and riding to scheduled time than in the more sedate and matter-of-fact touring.

A TOUR *in the* HIGHLANDS

Bridge of Orchy with Ben Douran in the distance. Farmers' carts are infrequently met on these lonely roads, and, as the horses are almost always shy, it is advisable to stop until they pass.

PART II.—Describing the Homeward Journey from Perth to the Midlands.

BACK to the comparative civilisation of Tyndrum and Crianlarich I struck frightful pot-holes, which are much worse than genuinely rough country roads, and then proceeded *via* Killin and Loch Tay (which seemed very dull after the scenery of the previous days) to Kenmore. Having by now come to look upon Scottish hills as much over-rated I essayed the famous climb on the run with insufficient water in the radiator, and steering with one hand while eating chocolate. My pride was quickly brought low, for on the second bend the wheel commenced to spin on the wet leaves which covered the ground. Restarting, I cut out on the next (left-hand) hairpin, fearing that the sidecar would lift on the projecting rocks. The engine refused to pick up, and starting again was not easy, but I just got going well when the first gate barred my way. Opening and closing it meant two restarts, and the radiator was now throwing out clouds of steam. A water-trough by the roadside, however, supplied the needful, and with a stop at the second gate I reached the summit in chastened spirit.

Down Amulree.

Dropping down Amulree cautiously I decided to make up lost time along the Sma' Glen, but the weather willed otherwise, and sheets of rain fell. The rough Perthshire roads became like rivers, and I gladly entered Perth to rid myself of my dripping clothing.

The next two days were taken quietly, the only run being a trip to St. Andrews, while on the following day the performances in the Scottish Trials were observed on Amulree for the benefit of the readers of *The Motor Cycle*.

Two days were now left for the run home to Coventry, but owing to the never-ending rain a start was not made until 11.30 in the morning. The first twenty miles provided plenty of incident. First the rear tyre punctured, then the chain (badly stretched and needing replacement) jumped off, and finally the carrier stays came unbrazed. Fortunately, however, the weather cleared and I kept on full throttle as far as possible, only slowing up over the wicked pot-holes of Stirling and Cumbernauld.

A Long Run.

Just near the border a loud rattling compelled me to stop, and I discovered that the vibrations of the loose carrier had caused the fork-end bolt to come adrift. Replacing this with a stand bolt I was on my way in ten minutes, and thanks to better weather made good time. I now decided to get to the Scott works in Yorkshire and have the carrier patched up, and so *via* Carlisle, Shap, Kendal, and Skipton I made for Leeds, where I arrived at 1.45 a.m., after fourteen hours continuous riding, all on top gear.

The repairs occupied so much of the next day that I decided to spend another night at Leeds, from which place the run to Coventry occupied some six hours.

So ended 1,200 miles eventful riding; petrol consumption, thanks to the delightfully controllable Cox Atmos carburetter, was 55 m.p.g., oil consumption was slightly under one gallon for the whole trip, while two punctures were experienced, and the driving wheel cover was exchanged for the one on the sidecar. Three sidecar shock-absorbing springs were replaced, but the main springing was intact, while the only real mechanical trouble experienced was the breaking of the carrier. Such a result over so many miles of wild country is not at all unsatisfactory—the amazing part is that the outfit suffered so little. WHARFEDALE.

In the Mountainous North.

(1) Reminiscent of Switzerland : Castle Urquhart, on Loch Ness, near Drumnadrochit.

(2) A dismal scene in pouring rain ; patiently awaiting the ferry boat to cross the narrow and swirling outlet of Loch Leven at Ballachulish.

(3) A wild scene, of tragic memories. Glencoe, more than any spot visited, enables one to realise the great height of the mountains.

(4) The Pass of Glendoe, looming high against the rain clouds over Loch Leven ; in the foreground are masses of *debris* from the Glencoe slate quarries

IMPROVING THE SIDECAR.

Details in Chassis and Body Construction of Some of the Latest Productions.

THAT the sidecar will survive all assaults from designers of three-wheeled runabouts produced in the future as a substitute is an opinion shared by thousands of our readers. The sidecar has a long start, and to-day it is the most popular vehicle on the road. Further, a great deal of attention is now being paid to design in both chassis and body construction. The two tracks of the sidecar, too, from an advantage over the three-track three-wheeler, and the chances are always in favour of the former being the more comfortable on bad roads.

Among the several new designs submitted recently, the all-steel construction of Bachelier sidecar chassis is perhaps the most interesting.

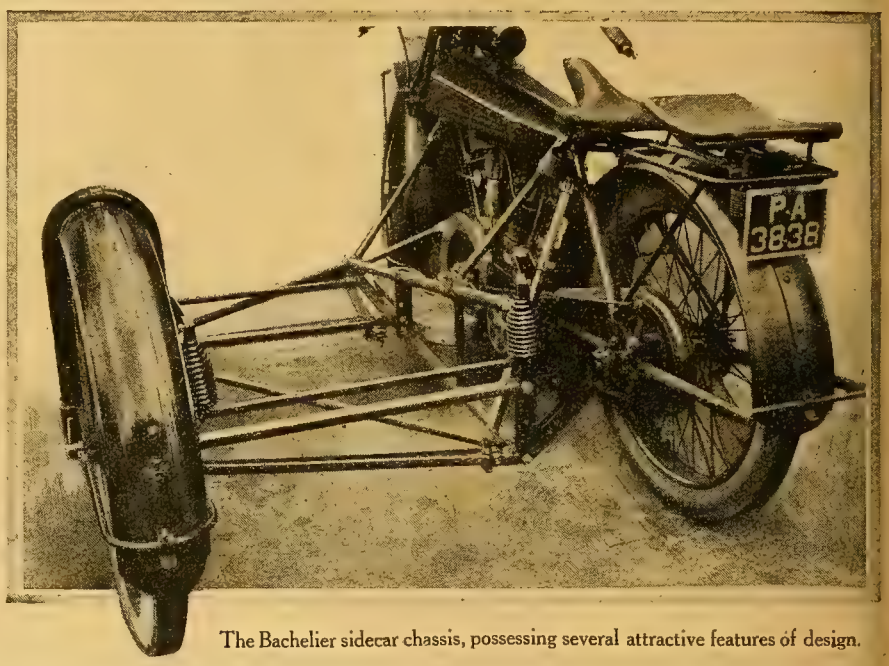
Steel tubes are used throughout, and an interesting feature in the construction is the use of two steel triangular plates held together by bolts, which, on one side, form a vertical support for the two off-side longitudinal members, whilst the adjacent angle of the plates is connected through a heavy steel attachment to the rear fork of the machine.

Five Points of Attachment.

A five-point attachment is provided, and the two front connecting tubes join the chassis at a point from which both the diagonal cross member and the two off side longitudinal members are held. These latter two are triangularly constructed. The usual saddle tube member is attached to the upper longitudinal member, and, as an additional precaution against a possible breakage, a steel tube, anchored to the lower of the two rear cross members, is fixed half-way down the saddle tube.

Another feature, incorporated to ensure maximum strength, is the one-piece tube which is fixed to the near side longitudinal member, and is bent to provide a cradle for the sidecar wheel, thence extending laterally beneath the body, forms one of the cross members. The bearers are suspended on two laminated springs at the front, and, at the rear, on two coil springs.

The total weight of the chassis is 85 lb., including the wheel, tyre, and mudguard, and it will shortly be marketed by Mr. L. G. Bachelier, 74, Arthur Road, Wimbledon Park, S.W.



The Bachelier sidecar chassis, possessing several attractive features of design.

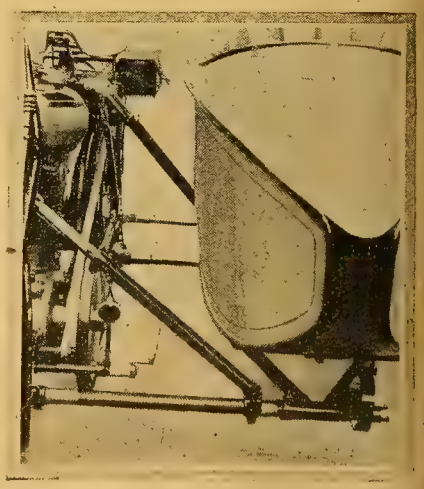
The Coulson Spring Wheel Sidecar.

Another interesting design is that of the new sidecar adopted by the makers of the Coulson-B motor cycle. A similar system of springing has been adopted for suspending the wheel as is to be found in the motor bicycle.

On an extension of the centre cross member of the sidecar frame there are rigidly attached the front ends of two quarter-elliptical springs arranged side-by-side. The free ends of these springs are attached to a link, the four members of which are solid, carrying the sidecar wheel spindle, which is free to move on an extension of the rear sidecar cross member, which, in the ordinary way, would be the sidecar axle.

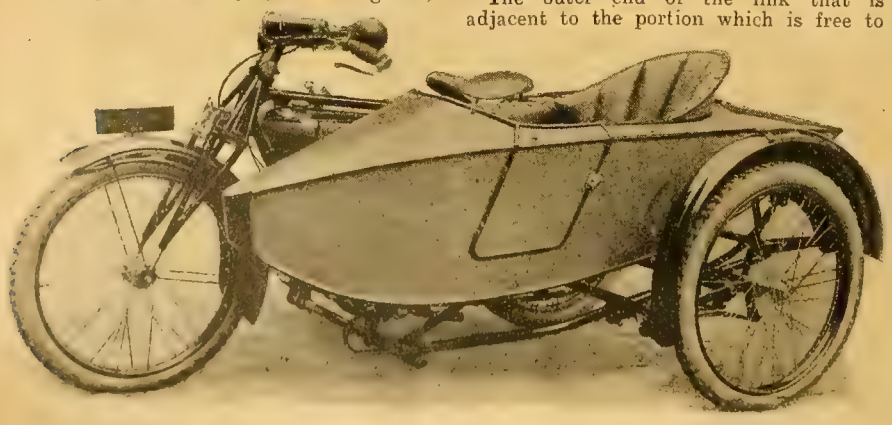
The outer end of the link that is adjacent to the portion which is free to move on the member referred to is provided with an adjustable disc, which allows any side play to be taken up.

The chassis is designed to be fixed to the 4 h.p. Coulson-B at five points—to the pivot bolt on the rear axle of the motor bicycle, to the saddle tube, to the near side spring lug which braces the motor bicycle frame sideways, to a special lug under the forward engine plate, and to the down tube of the motor cycle frame. All the connecting tubes are straight.



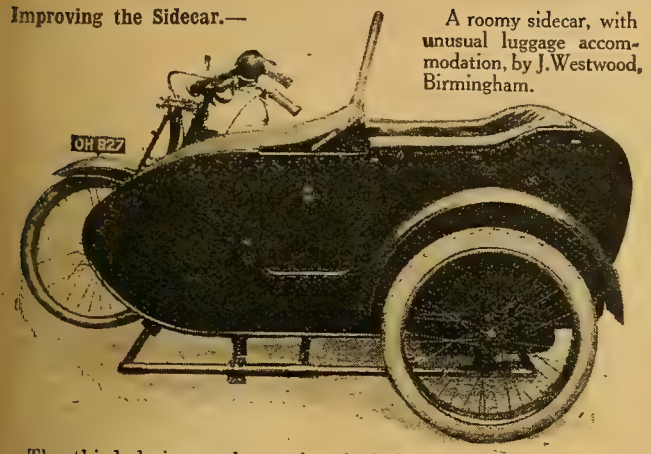
Observe the five straight tubes attaching the sidecar chassis to the motor cycle.

The body is comfortable, and is suspended on rather stiff quarter-elliptical springs. The idea of making these springs stiff is to ensure steady riding, the initial road vibrations being absorbed by the spring wheel.



Care has been shown in the design of the Coulson-B. body as well as in the chassis, and the whole sidecar from all points is decidedly attractive.

Improving the Sidecar.—

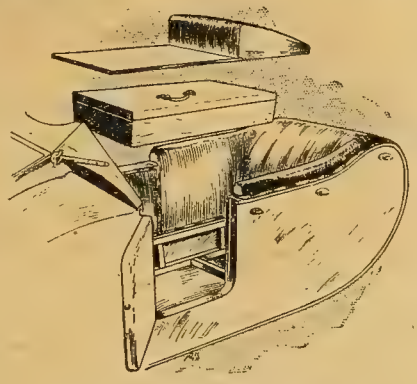


A roomy sidecar, with unusual luggage accommodation, by J. Westwood, Birmingham.

The third design under review includes innovations in both chassis and body design. This is the production of Mr. J. Westwood, 31, Swindon Road, Edgbaston, Birmingham, who has endeavoured to provide a roomy body, with special luggage accommodation, on a chassis which embodies a patented system of suspension. Coil springs are used to support the body, which is sufficiently large to include a large rear locker suitable for the carriage of two petrol tins and all that is required, and more, in the way of spares and tools.

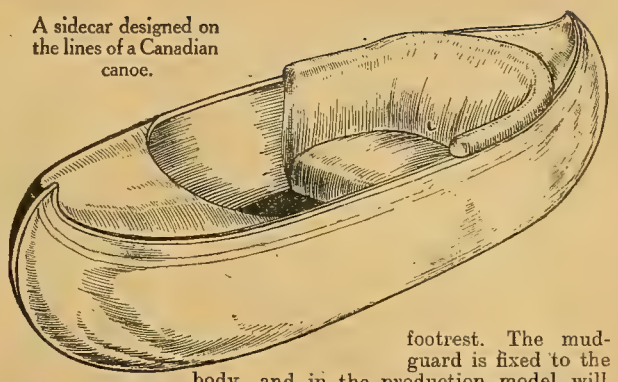
Specification includes a Suitcase.

A feature of the design is that beneath the floor boards there is a suitcase (made specially for the body) which is large enough for week-end requirements. In the nose of the body there is an adjustable footrest. The mudguard is fixed to the body, and in the production model will be exceptionally wide with deep valances. The upholstery is well carried out, and, what is most important in sidecar comfort, the back cushion well supports the back.



Showing how a case is carried beneath the floor of the Westwood sidecar.

A sidecar designed on the lines of a Canadian canoe.



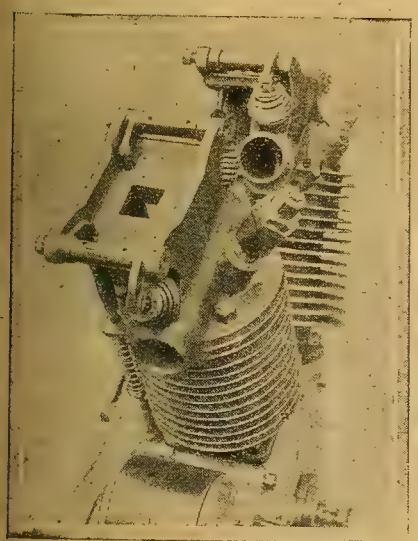
A Canoe Design.

The last illustration depicts the registered design for a sidecar body by Mr. Frank B. Bird, of 17, Burleigh Road, Loughborough. The general outlines of the Canadian canoe has been closely followed, and may be constructed of wood or metal. We understand that it is not the intention of the designer to market a sidecar of this design, but is open to consider the question of granting manufacturing licences.

Boat designs are not new: several have been made which are miniature boats, but this one certainly combines the beauties of water craft with that for the road.

ENGINES IN THE MOTOR CYCLE GRAND PRIX.

THE French Motor Cycle Grand Prix was a battle between the flat and the V twin engine, for undoubtedly the two fastest machines were the Douglas and the Alcyon, which latter ultimately proved itself the winner. It should be observed, however, that the English machine, ridden by Alexander, was put out of the race by trouble, quite independent of the engine, and but for the stripped gear the result might have been quite different.



A French racing design, the V twin 62 mm. by 82 mm. Alcyon, showing the peculiarly shaped detachable cylinder heads which support the overhead valve rockers.

A French V Twin.

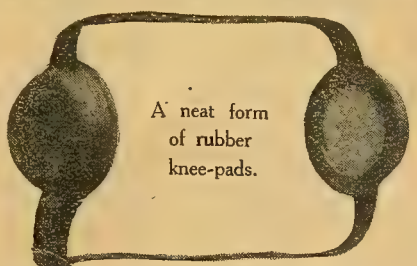
The winning Alcyon ridden by Joly is a V twin of 62 by 82 mm. bore and stroke, having a very interesting type of cylinder with separate head and two inclined valves. These latter are operated by two rocker arms, the shafts of which are received in an extension cast with the head, as shown in the illustration. An adjustable push rod with light coil spring is used to operate each rocker. An excellent form of combustion chamber is obtained with this design, and the plug, inclined between the two valves, is also well placed. The carburetter is bolted up as closely as possible between the two cylinders, with a separate induction pipe for each cylinder direct from the carburetter.

Both the twin and the smaller single cylinder Alcyons used all chain drive, a short chain being employed from the engine shaft to the change speed gear, and a second chain from this to the rear wheel. The French have always been clever engine designers, and the post-war products of France's motor cycle manufacturers show great promise.

PNEUMATIC KNEE GRIPS.

KNEE grips are regarded by the majority of motor cyclists as a sign of the speed man. For a solo rider they are almost a necessity. In addition, they serve to protect the enamel on the tank.

Various manufacturers have different ideas of what a knee grip should be, and riders are divided in their opinion as to which is the better—the soft kind or the hard. There are many kinds of both types, but the knee grip just introduced by the makers of John Bull tyres appears to be something new in this line, taking the form of a pneumatic grip, priced at 6s. 9d. per pair. Each grip consists of an outer shell of rubber enclosing air. A disc of rubber inside the shell prevents collapse under pressure from the knees, and a single strap secures both grips to the tank. A round dozen competitors in the T.T. used these grips in the Isle of Man.



A neat form of rubber knee-pads.

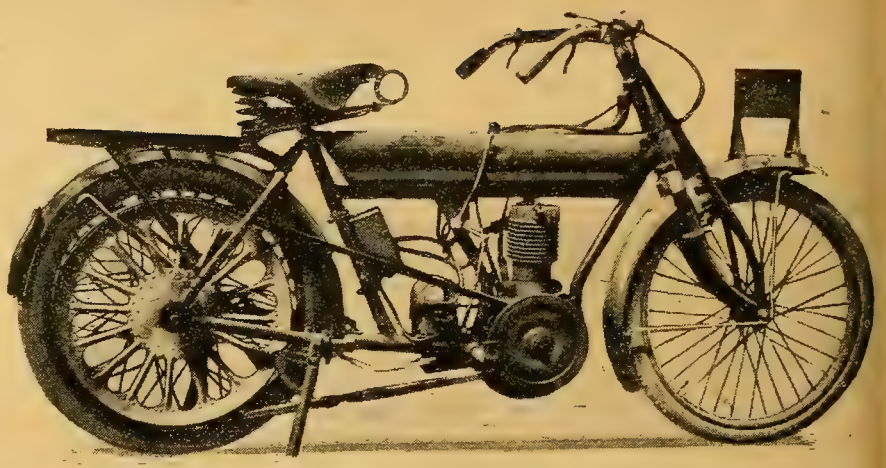
A Relic of Other Days.

A Sixteen-year-old Machine, still in Running Order, that possesses many Up-to-date Features.

READERS often ask us to advise them as to the possible useful life of a motor cycle, and the question is one which is extremely difficult to answer.

Given care and attention and sundry renewals of essential wearing parts, a well-built machine has an almost indefinite period of usefulness before it. We were never more convinced of this than recently when, spending a few days in Perth, we came across the machine depicted in the accompanying photograph. No doubt many older motor cyclists will recognise the machine as a Roc, which, in the earlier days of the movement, was one of the most prominent and advanced models before the public. The makers were amongst the pioneers of the long wheel-base and low saddle position. They also introduced one of the earliest practicable free engine clutches and at a later date popularised the famous Roc two-speed gear. Both these devices incorporated a live axle (with handle-starting).

As will be seen, the machine under discussion has quite pleasing lines, and is unlike the usual produce of 1904-5.



A sixteen-year-old motor cycle, which is still in commission; it is a Roc, with free engine clutch hub and low-tension ignition. The engine is a Kelecom, and it is fitted with an outside flywheel.

The engine is a 2½-3 h.p. Kelecom, produced by the famous Continental house of Antoine, and is unusual, in the light of latter-day motor cycle practice, in having the cylinder screwed into the crank case. An outside flywheel is integral with the pulley. The ignition is a "modernisation," and consists of a low-tension magneto and separate coil. A battery type of "make-and-break" is fitted to the magneto.

Power is transmitted to the Roc free-engine hub by a long belt; the clutch being operated by a pedal near the left footrest. The rear belt-drum is interesting, as it is built up from two pressings riveted together, and would appear to be quite as sound as the built-up variety with tubular spokes, which came into vogue at a later date when hub gears were more popular.

Perhaps the most striking feature of this old stager is the fact that no pedalling gear was fitted. In the days of "l.p.a.," this omission on the part of the designer was truly courageous.

A SINGLE SPRING FORK.

REDUCE the number of parts on any motor cycle and an almost certain reduction in cost will accrue. In the near future the general utility lightweight may have many fewer parts than it has in present-day practice. If for this reason alone the spring forks illustrated here may interest manufacturers of motor cycles for the masses. The design is extremely simple, consisting briefly of a fork member pivoted directly under the bottom steering column lug, and a laminated leaf spring anchored at its lower end to the pivoted fork and shackled at its upper end by means of two links.

This fork is the patented design of Mr. S. Robinson, 10, Bamford Road, Didsbury, Manchester.

Robinson's leaf-spring front fork

MAGNETOS FOR OPPOSED TWO-STROKES.

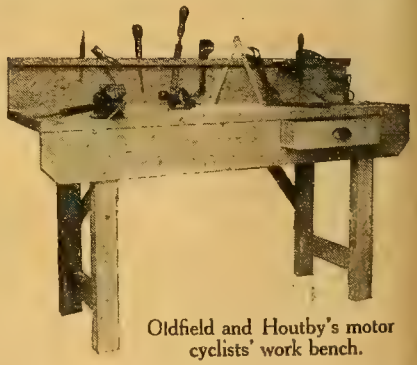
Numbers of surplus W.D. Levis flat-twin engines are now being sold, and many readers find a difficulty in obtaining suitable ignition apparatus. To save trouble we would assure them that it is hopeless to attempt to fire the two cylinders simultaneously by dividing the high-tension lead of a single-cylinder magneto into two separate and individual branches; either a "double-pole" plug in one cylinder or (a better way) a special "two-spark" magneto must be used.

THE OUTSIDE FLYWHEEL.

PRIOR to 1914 only one firm of four-stroke specialists consistently used an engine having an outside flywheel, but a great change has taken place since then. Most firms now consider the outside flywheel four-stroke favourably, and are either designing units embodying it, or contemplating the adoption of the well-known proprietary engines so fitted.

A USEFUL BENCH.

ONE of the most desirable fittings in a motor cyclist's workshop is a good bench. The essentials of a good bench are solidity, rigidity, and convenience. That under review, made by Messrs. Oldfield and Houtby, Wellington Street, Lincoln, conforms to these conditions. It has an excellent drawer for odds and ends, and a tool-rack running along the back, and can be supplied with or without vice, the latter being an extra.

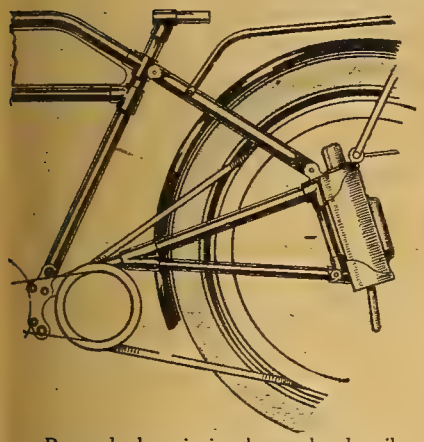


Oldfield and Houtby's motor cyclists' work bench.

The bench is 5ft. long, 18in. wide, and 2ft. 7in. high. The size of the drawer is 15 × 18in., while the tool-rack is 9in. deep, and runs the whole length of the bench. It is well made and mortised and tenoned. The bench has strong legs, which are suitably cross-braced. The bench, which is made detachable, can be easily erected, and is constructed of specially seasoned red deal; it is supplied in three sizes.

SPRING FRAMES AND FORKS.

A Selection of Readers' Ideas and Patented Designs.

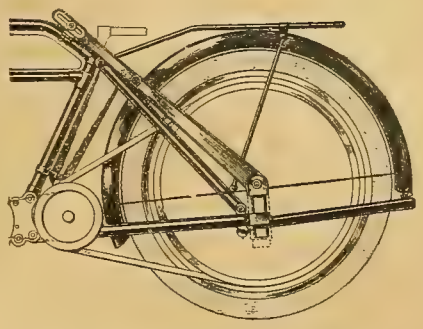


Rear wheel springing by enclosed coil springs—the subject of a patent granted to E. F. Harmer, Gresham Villa, Mansion Road, Southampton.

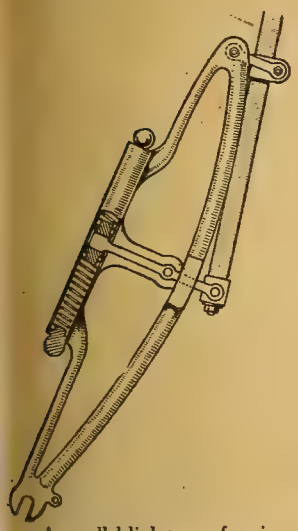
SCARCELY a day passes when our mail bag does not contain at least one suggested or completed design of spring frame or fork which is proof that riders and manufacturers have been seriously influenced by our campaign for more comfortable motor cycles. Some of the ideas submitted are quite good, others are the work of those who have not been able to follow all the designs that have appeared in these pages, for their efforts are along old tracks, and some of which have proved to be futile.

Necessity and Cost.

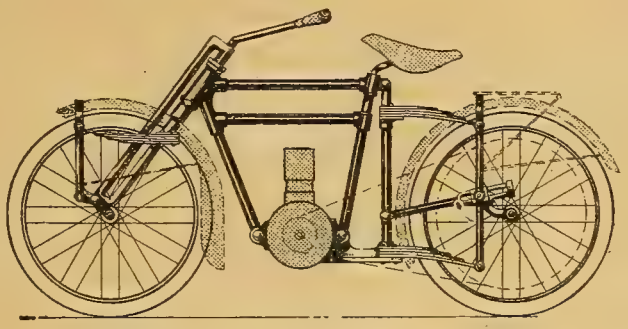
If necessity is the mother of invention, then, indeed, the need for spring frames is great. At present we think that the reason more manufacturers are not adopting spring frames is entirely one of cost, as we know of several excellent productions which the makers hesitate to market on the score of price.



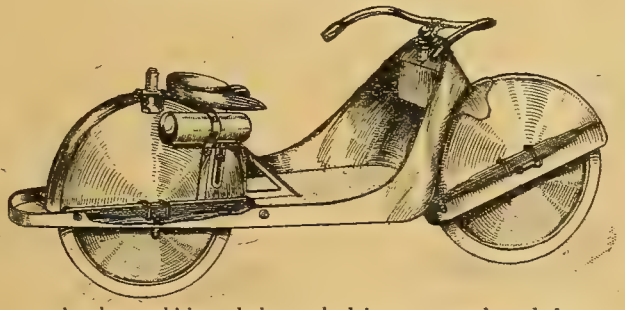
The Concentra spring frame, another patent by E. F. Harmer, in which a double quarter elliptic spring is used. This device can be adapted to existing machines.



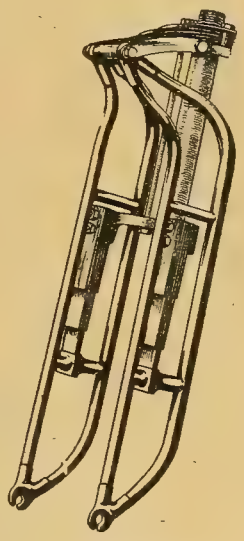
A parallel link type of spring fork designed by A. Skinner, 15, Norcross Avenue, Tinsley, Sheffield. Observe the leverage obtained on the lower links and their connection with the enclosed coil springs.



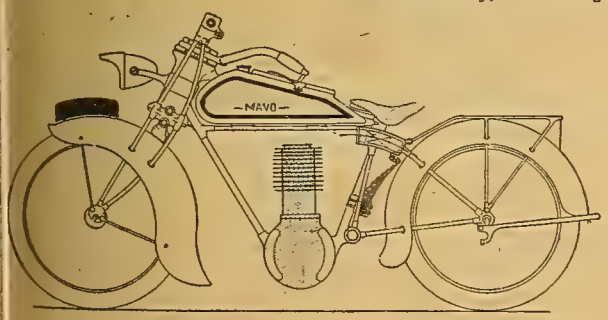
Soper's spring fork and frame. The latter is reminiscent of the T.M.C. four-cylinder machine.



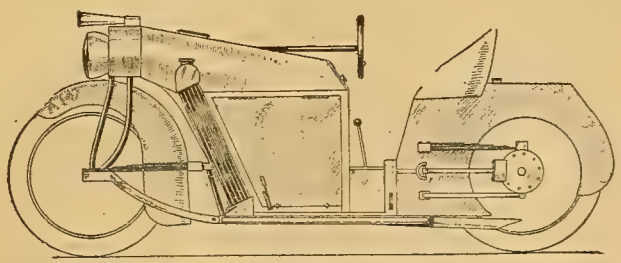
Another ambitious design embodying a pressed steel frame suspension by half elliptic springs, etc., the patent of Mr. G. G. Ommanney, Court Lodge, Westwell, Ashford, Kent.



Leaf springs are favoured by the designer of this fork, patented by H. W. E. Dickson, 1, Moseley Park Villas, St. Mary's Road, Moseley.



An unconventional design by Lt. P. L. Mayo. The front springing is embodied within the steering head.



An elaborate "design" submitted by a reader who signs himself "Amateur Schemer." His idea is to produce a machine which shall be practically a mono-track car.

LETTERS TO THE EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters must be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

SPEEDOMETER FITTING.

Sir,—I have read the letter of "Speedometerless" in your issue of August 19th with great interest.

I have had many machines, all fitted with Cowey's speedometers, and never had a bad fitting one, as this firm makes special brackets for all makes of machines, so that the collar of the nut on the off side of the spindle always screws into the rebate in the fork; no accident can then occur.

I am sure the above is not known to many owners of the above make of speedometer, and hope the information will be of use to them. I am only a satisfied owner.

V. F. LONG.

MOTOR-ASSISTED BICYCLES.

Sir,—In reference to "B.Y.'s" letter of the 2nd inst., *re* the J.E.S., I would like him to know that I find this machine will do anything from 5 to 25 m.p.h. at a consumption of 160-180 m.p.g.

I might also say that when it is on the stand it will start from cold the first kick of the pedal, provided, of course, it is in tune.

I had one myself, second-hand, and it would pull two men on cycles, one on each side of me, up moderate hills. I have also pulled one man on a cycle for sixteen miles of bad roads without a hitch.

T. BAINES.

MYSTERIOUS NOISES.

Sir,—Having recently had occasion to retime the ignition of my 8 h.p. Matchless I took the machine out for a short trial run. I was not long on the road when I became aware of a clinking noise which synchronised with the beat of the engine. A peculiar feature of the noise was that it was only present with the ignition lever in a certain position. I concluded that I had rashly interfered with the timing, and I determined that in future I would leave well alone. I was at a loss to discover the cause, as an external examination of the engine revealed nothing, and as I had previously had trouble with the piston of the front cylinder I concluded that nothing less than a complete overhaul could solve the mystery. I therefore drove home very gingerly.

Just as I stopped at the door of my garage with the engine running free I glanced down at the magneto driving chain which I had left bare for the easy adjustment of the timing. The said chain was "hopping all over the place," and at each beat of the engine produced a most delightful "clink" by striking the inside top of the aluminium case. Such a noise becomes inaudible when the cover is replaced, as I proved afterwards. Perhaps some other reader will explain why the noise was only present when the ignition lever was in a certain position. The problem is too hard for Dublin.

DUFFER.

SPEED AND RELIABILITY.

Sir,—What *is* the matter with "Ixion"? So the B.S.A. is *not* fast and the Norton is *not* reliable. What a libel!

He did not actually say so, of course. That would not do, even in his leg-pulling page; he merely leaves that impression, and yet at a certain speed trial the B.S.A. beat a Norton (I was driving the Norton), and the B.S.A. also figures in the record lists.

I have a faint recollection of a Norton doing well in some reliability event (I was not driving this time), and the name Norton figures in the record lists, too.

This seems to confirm an impression received during the T.T. race that there is a possibility of a fast machine being reliable, and a reliable machine being fast. Seriously, however, quite a large proportion of motor cyclists hold the opinion that reliability and speed are seldom combined in a machine, when, as a matter of fact, the one largely assists the other. Reliability calls for reasonable strength, simplicity, and durability of parts. Speed demands all these with great strength and correct design. It also calls for light (not flimsy) parts, because such lessen stresses and strains, lessen bearing loads, lessen vibration, and the danger of fatigue of metals.

To obtain high speeds every part must be correctly proportioned, must be in harmony with its neighbour, all negative work in the engine must be reduced to a minimum, and the whole mechanism must be capable of standing up under the greatest strain it is possible to subject it to. What does this mean? It means that the factor of safety, the reliability factor, is very high indeed, being designed to "stand the racket" of maximum power. Ordinary touring work does not even approach its limit; it makes light of it as a Sandow with a bar bell of bubbles. There is plenty in hand to resist the shocks and strains of use and misuse—in short, being suitable for speed, it is the acme of reliability. All machines are reliable so long as they are in no way overstressed.

The range of reliability is great or small in proportion to the capability of resisting great or small stresses.

JAS. L. NORTON.

MINIATURES.

Sir,—I read with interest the letter by Gilbert Camplings in your issue of August 19th. I would like to state that, as the owner of one of their handy little mounts, I thoroughly endorse all their remarks. By way of personal proof for reliability, I recently made a journey to Hornsea

R. C. Sissons and his Skootamota. (See accompanying letter.)

(Yorks.) and back, a distance of fifty odd miles. This was a non-stop run, except for filling up once at a garage. My speed during the whole run averaged out at 13½ m.p.h., and petrol consumption in the neighbourhood of 90 m.p.g. The only discomfort was that caused by dust, and the absence of goggles was keenly felt. I may add the usual disclaimer.

R. C. SISSONS.

WHY PEOPLE PRAISE PELMANISM.

"FACTS THAT TELL" FROM READERS OF EVERY TYPE.

"HOW is it that you have made such rapid progress during the last twelve months?" enquired a business man recently of a friend, who, to the great astonishment of his colleagues, had received no fewer than three promotions, with corresponding increases of salary, in quick succession, and who now occupies the position of manager of his firm.

"I have taken up Pelmanism," was the reply, "and it has changed my whole outlook on life, and given me prospects I never thought would be mine."

The Result of the Conversation.

What was the result of this conversation?

Why, that the business man in question called at the Pelman Institute the next time he was passing, and enrolled for the Course himself.

Facts similar to this one are constantly being brought to the notice of the Pelman Institute, and as they explain "why people praise Pelmanism," it has been thought that it would interest readers of *The Motor Cycle* to give a few of them on this page.

Readers who would like further information on the subject are invited to visit the Pelman Institute, 199, Pelman House, Bloomsbury Street, London, W.C.1, or to write for a copy of "Mind and Memory," which will be sent gratis and post free, with full particulars of the New (1920) Course, to any address on receipt of a postcard or letter.

People who get Promotion.

Many people owe their success in life to the power of working rapidly.

If you have the power of working more rapidly than others—provided that work is efficient—you are bound to get on.

Suppose there is a particular piece of work to do. One man, by no means an inefficient worker, takes the whole day about it, and finishes it by the evening. Another, a quicker worker, who has trained his mind *to get quickly off the mark*, finishes it by the middle of the day. This power of rapid, concentrated working, which is developed by Pelmanism, means greatly increased output, less waste of time and energy, more leisure, and, of course, increased payment. A man like this is invaluable to any employer, and is picked out for speedy advancement.

A Chemist and his Career.

Here is a case in point.

Pelmanist A25064 is a Works Chemist. He had a very stiff examination to pass. In the ordinary way this examination entailed a whole year's preparation. But this man, being a Pelmanist, passed the examination after only three months' work, a saving of nine whole months.

But this is not all. He writes:

"I have attained the position of Works Chemist in a large provincial Gasworks at least three years sooner than anticipated."

So, owing to his power of rapid working, he saved nine months on his examination and three years on getting his promotion. He now holds the position which he had only hoped to get in three years' time.

This is what he says:

"I attribute these results entirely to the application of Pelman principles to my active and latent abilities, and I have only just started to apply them."

Saving Valuable Time.

But it is not only business men and women who find this faculty so valuable. It is a quality of the utmost value to everyone. The barrister who wants to master the details of a difficult brief, the artisan who, after doing his day's work in the workshop, employs his time "after working hours" in studying some economic, historic, or literary subject, to these and to others this faculty of eliminating waste of time and working more quickly and easily is absolutely invaluable. And this is only one of the faculties developed by the New Pelman Course, particulars of which you can obtain free to-day on application to the address given on this page.

Making More Money.

The work which Pelmanism is performing in enabling men and women to earn more money is of especial importance in these days of high prices.

There are many people who are not progressing as they ought to do. Certain mental weaknesses are keeping them back. Consequently their incomes are not keeping pace with the rising cost of living.

Pelmanism alters all this. It enables you to put forth your full powers. It enables you to save waste of time and energy. It gives you the power to take on work previously beyond your capacity, and it enables you to do this work well and to "make good."

That is why Pelmanists in every profession, business, and occupation are forging rapidly ahead, trebling and quadrupling their incomes and securing swift promotion to higher positions.

Incomes Trebled and Quadrupled.

The following brief extracts from Pelmanists' letters are cases in point:

"During the past half year my income has increased by over 100 per cent."—CLERK.

"Gained increase of £150 per annum."—ELECTRICAL ENGINEER.

"Secured a net increase of salary of 400 per cent."—EX-CAPTAIN.

"Delighted with my progress, both monetarily and mentally."—TECHNICAL MANAGER.

"My income has gone up 300 per cent."—ARCHITECT.

"I have improved 300 per cent. in salary."—CLERK.

"I benefit to the extent of £1,000 this year."—IMPORTER.

"Since taking up the Course I have more than trebled my income."—CLERK.

"I have secured three increases of salary in five weeks."—BRANCH MANAGER.

"Thanks in a great measure to the benefits I have received from Pelmanism, my career has been an unbounded success, and I have gone on from one success to another."—CIVIL SERVANT.

"After taking up Pelmanism for about three months I was offered a very high post in the firm in which I am employed. This advancement, which incidentally doubled my salary, I attribute entirely to Pelmanism."—DEPARTMENTAL MANAGER.

Hundreds of similar cases could be quoted did space permit. More will be found in the book describing the New Pelman Course, which any reader may obtain to-day, *free of cost.*

The New Pelman Course.

The New Pelman Course, which is now ready, is a great improvement on the former one.

Indeed, *Truth*, after a careful examination of the Course, says that it is "100 per cent." better.

The New (1920) Pelman Course, says *Truth*, removes from the mind such mental difficulties as:

Forgetfulness	*Dullness*
Mind Wandering	*Weakness of Will*
Brain Fag	*Lack of System*
Indecision	*Lack of Initiative*
Shyness	*Indefiniteness*
Timidity	*Mental Flurry*

and it develops, on the other hand, such fine and valuable qualities as—

—Concentration	**—Directive Ability**
—Perception	**—Self-Confidence**
—Judgment	**—Driving Power**
—Initiative	**—Self-Control**
—Will-Power	**—Tact**
—Decision	**—Reliability**
—Ideation	**—Salesmanship**
—Resourcefulness	**—Right-Directed Energy**
—Organising Power	**—A Reliable Memory**
—Forcefulness	

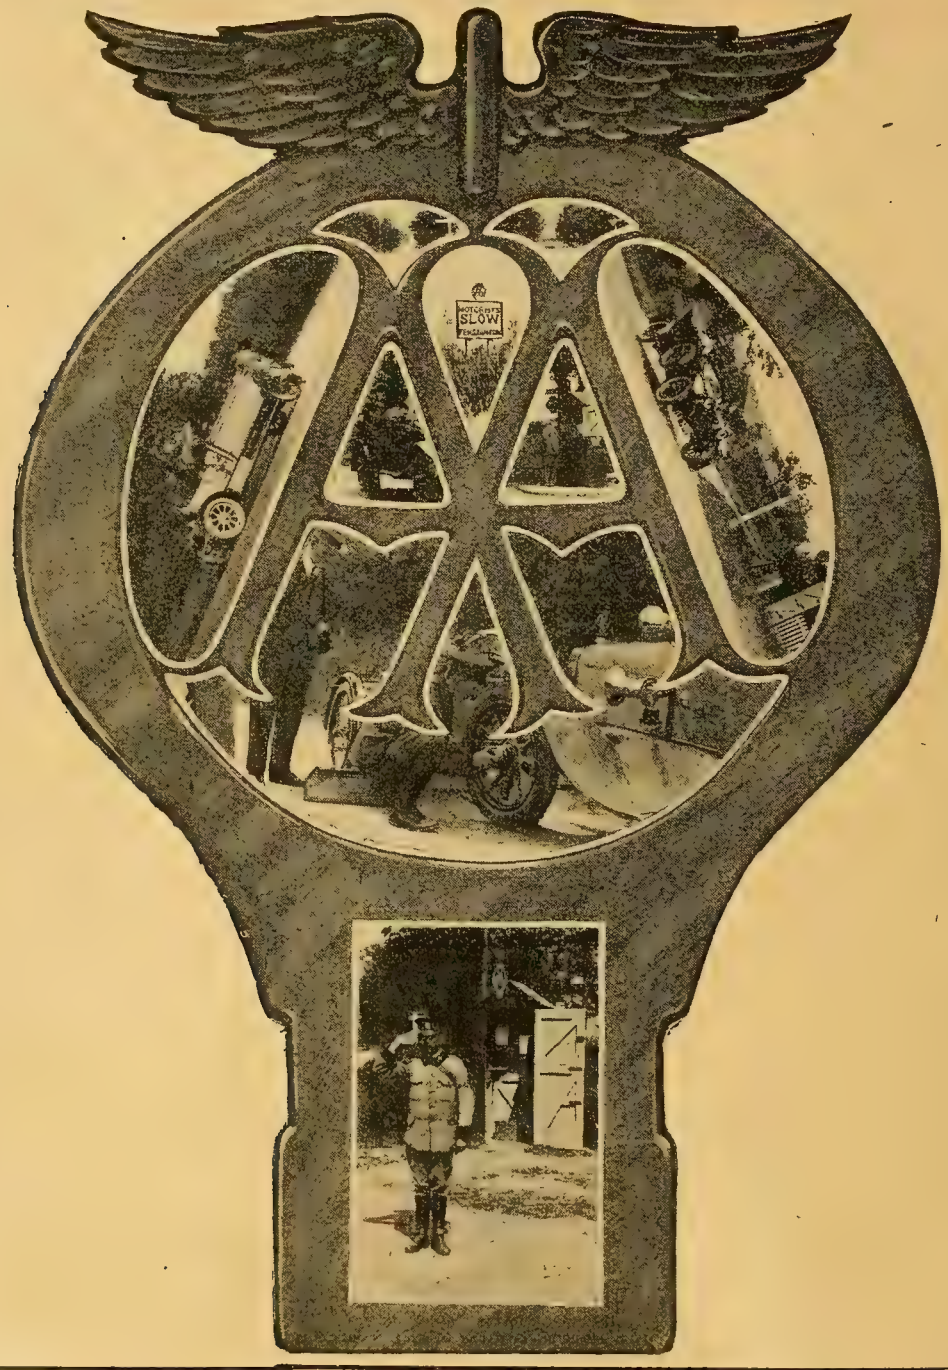
Fascinating Exercises.

Further, the New Course is extremely interesting. It grips you from the first, and the exercises become more absorbing and fascinating as the Course proceeds.

Not only do you take a delight in practising these exercises, but you experience at the same time the deep gratification of feeling and knowing that your mind is rapidly becoming more and more efficient. With your mind working accurately, clearly, and rapidly, and with all your intellectual powers perfectly co-ordinated and acting under the full control of your will, work becomes a pleasure, because you know you are doing it well, and doing it, too, with plenty of time to spare. Instead of being hustled, confused, and anxious, as perhaps you were before, you are now able to carry out your daily duties calmly, serenely, and without fuss and undue effort. You are the master of your surroundings and of your work.

All this Pelmanism helps you to do, and to be, and by the time you have finished the Course you will have secured a complete mastery of the science of scientific mental training, which you will be able to apply immediately, as so many thousands have done, for your own personal pleasure, profit, and advancement.

Readers who wish to know more about this really remarkable system should write to-day to the Pelman Institute, 199, Pelman House, Bloomsbury Street, London, W.C.1. By return they will receive a *Free Copy* of "Mind and Memory," and full particulars of the New Course which is enabling so many thousands of people to become successful and which will help you to do the same.



The Badge of Efficient Service.

The A.A. Badge brings assistance to the motor cyclist stranded on the road miles from a town or garage. It gives access to the roadside telephone boxes and summons a "mechanical first aid" machine. It solves all questions regarding routes for home tours and dispels the trouble and delay usually associated with a tour abroad. It provides free legal defence, engineering assistance, etc., etc.

Send a postcard to-day to the Secretary, The Automobile Association, 21, Fanum House, Whitcomb St., London, W.C.2., for a copy of "The Key to the Open Road," which describes the many personal benefits *you* can secure through its influence

THE ISLE OF WIGHT FERRIES.

Sir,—Mr. E. Martin's letter on Isle of Wight steamers, etc., may be quite correct, from a solo Douglas owner's point of view, but I found it much more difficult and expensive with a sidecar. First of all, the Southampton, and probably the Lymington, passenger boats have no convenience for transhipping such outfits unless they can be taken apart. The Portsmouth or South-Western Railway boats have derricks and proper carriers.

I found that the cost of each way for a sidecar outfit and myself was 10s. 2d. plus 1s. 2d. pier dues at Ryde. I had to sign some form of declaration, which I did not read. The ticket collector made me soak out what little petrol I could not drain out with a piece of rag, to the detriment of my carburetter, which I had to take to pieces three times while on the island to clear out the fluff which choked the adapter. I regret that I cannot agree with Mr. Martin as to the state of the roads. With the exception of the road between Ventnor and Sandown the roads are rough and dusty, and in wet weather must be appalling, as they are built of gravel. They are very narrow, with right-angle bends at frequent intervals, and, with the present char-à-banc traffic, dangerous: so dangerous, in fact, that the proprietor of the hotel where I stayed the night insisted on me starting an hour earlier than I had intended, so that I should not meet the stream of chars-à-bancs coming in the opposite direction.

I am satisfied that he was quite right, as there was not room to pass another sidecar—except in a few places—for some miles.

There are very few direction posts, and 50% of these are undecipherable. HO 4508.

PETROL CONSUMPTION.

Sir,—A few weeks ago a letter appeared in *The Motor Cycle* from "Not Infallible," stating that he was able to get 106-113 m.p.g. with his "Scott," he having fitted a Degory carburetter. Afterwards a letter appeared from A. K. Gordon, stating that he was doing just over 40 m.p.g. and wondering if "Not Infallible" had ever tried a Binks on his Scott.

Now, I have a Binks fitted to my 3¾ Scott, and have just completed 440 miles (by speedometer), the petrol consumption being four and a half gallons, less a good pint (by measure), which is still in the tank. This works out at just over 100 m.p.g. Two hundred miles of this distance was done with a pillion passenger, the average speed being 20 m.p.h. The remainder was all in short journeys of about ½ miles at an average speed of 25 m.p.h. This consumption seems to be very good, especially as I have always to inject before starting (unless on an incline), which further reduces the quantity used in actual running. A.G.T.

Cumberland.

Sir,—As another claimant to the honour of covering most miles per gallon, will you kindly allow me space to state my case?

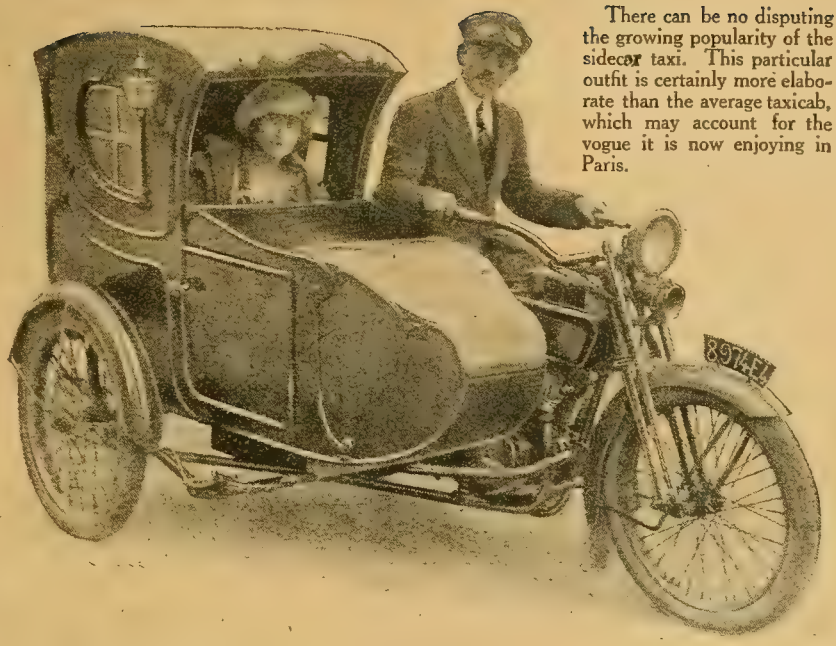
I have a 1914 2¾ h.p. Sunbeam, which is fitted with a Binks carburetter.

On a recent trip to the East Coast I figured out that I was doing about 220 m.p.g. The recent letter of Mr. S. Cook in your columns, stating that he had done twenty-four miles on a pint of petrol with an A.J.S. 2¾ h.p. model, determined me to make an actual test of what my machine was capable of. This is what happened.

I fastened a small tin to my machine, and under observation a pint of Shell No. 1 petrol was poured in, and the tin sealed up.

We then adjourned to a point on the Old Chester Road, which runs from Birkenhead to Chester. Starting off, I journeyed to Chester and back, covering a distance of twenty-seven and one-tenth of a mile, which works out at 216⅝ miles to the gallon. Can anyone beat it? The machine I use constantly—it suffers from no lack of power, and is here for anyone to see, and ready to do the same again; and, if on a gallon instead of a pint, would no doubt give even better results. The secret is that I have it in perfect trim, and adjusted down to a fine point.

Rock Ferry, Cheshire. SIDNEY HUGHES.



There can be no disputing the growing popularity of the sidecar taxi. This particular outfit is certainly more elaborate than the average taxicab, which may account for the vogue it is now enjoying in Paris.

CANDID CRITICISM.

Sir,—I wonder if the closing down of the Sopwith Aviation and Engineering Co., Ltd., will be a lesson to the other manufacturers whose prices are gradually climbing upwards? If not, I fancy this company will not be the only makers to "go west."

It is all very well to make "to an engineer's ideals," but, apparently, "experts" did not buy. Had the firm catered for the masses another tale might have been told. Had the company done so we might have got a real, cheap motor bicycle by now. From a provisional £75 to £150 actual is "some" jump. Mass production here seems to increase prices.

The O.K. Union? Yes; I fancy it was to be thirty-eight guineas. Is it? Now we are asked £95 for an elaborated scooter. (Unibus.)

Last winter (December) one could buy in America a light car, two bucket seats, V air-cooled, o.h.i.v., 1,144 c.c. engine, two speeds and reverse and bevel drive, 45 m.p.h., 45 to 50 m.p.g., for £60. Spacke! The finish was awful; but it went. Went? Yes; anywhere. But if you wanted to buy one you had to wait three weeks; but you got it then. The firm are catering for a new lot of buyers—not the old ones dished up. That is what our manufacturers seem to be doing. Why cannot our makers see that of the hundreds who *want* motor bicycles a very small percentage can *afford* them.

If new makers come into the trade they must cater for a new lot of buyers or go to the wall. Let any maker turn out a bicycle with simplicity and cheapness as its keynote. I mean, go the whole hog. If a coil and accumulator is cheaper than a magneto, use it. If a.i.v. is cheaper than m.i.v., use it. Why a petrol tank should cost £2 and a two-gallon tin 4s. (and it would answer the purpose) seems a bit of a mystery.

I ordered three machines since demob., but cancelled them on notification of increased prices. There is no excuse or justification for such a thing. Where is the business honour? I suppose our motor makers have not heard of it. I wonder what my customers would say if I worked on the same lines. I am afraid my "occupation is gone" would be my lament.

I paid 4s. 6d. for a Royal Enfield valve cap (which fitted my machine), but the price for an Indian in America is said

to be 25 cents. Is it not ridiculous, when wages there are much higher than here?

I read an article once by a young man who wanted a good *de luxe* machine, and was willing to pay for it. It seems to me *all* the makers are catering for such as he.

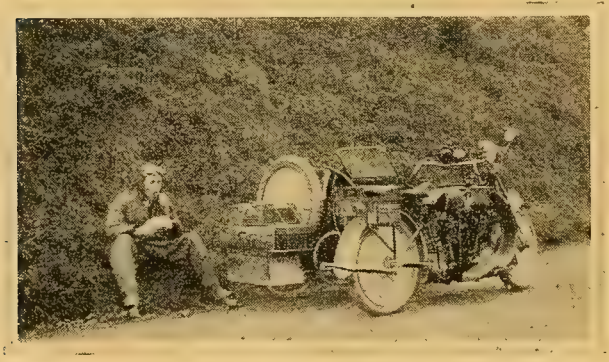
Horsehay, Salop. C.V.T.

[We publish this letter as an example of the kind of talk which is prevalent among a large percentage of motor cyclists. It bears out the general impression of the buying public that during the last twelve months the British manufacturer has made big profits. So far from this being the case, in many instances the financial position would not stand minute investigation. Our correspondent seems to forget that price increases have not been made by firms without good cause. He must be aware that the demands of labour have necessarily had to be met on several occasions, both by the suppliers of raw materials and the manufacturers of the machines themselves. All this is reflected in the price of the machine. We find that the closing down of certain works is not due solely to scarcity of orders, but mainly to the fact that the firms, due to high wages and restricted output, are actually losing money on each model supplied.—ED.]

A DEVONSHIRE TOUR.

Sir,—I thought you would be interested to know that my friend and I have just completed a tour of Devon and Cornwall, consisting of 845 miles, without experiencing any trouble at all; mechanical or tyre trouble.

We climbed Porlock Hill without retarding the magneto at all, and many other hills which you know are in abundance in that region.



Lunch on the way. (See letter, J. N. Snape.)

I enclose a snapshot of the machine in touring trim which was taken "somewhere in Devon." You will note quite a large locker under the sidecar carrier. It is very much larger than that fitted on the standard A.J.S. sidecar. It is an idea of my own, and consists of a wooden chest (with three bands of steel round it for security), and is divided into two compartments: one for a tin of petrol and the other for a half-gallon tin of oil. (It is fastened by means of lock and key.) Needless to say, I found this very useful during the tour.

Speaking of the roads, on the whole we found them quite good, although the surfaces on some of the hills are atrocious, especially Porlock. J. N. SNAPE.

P.S.—The interior of the locker is not lined by felting, but is just made a tight fit, consequently there is no vibration at all.

FOOTING AND FOOT-SLOGGING.

Sir,—I was very much interested in "Ixion's" article *re* "Footing and Foot-slogging," in your issue of September 9th. I quite agree with him that there is a general inconsistency of observers, etc., *re* their reports. As the final results depend somewhat on the reports as sent in to headquarters, it is important that such reports should state exactly what happened and where.

The Birmingham Motor Cycle Club, to avoid any such inconsistency in reports, send out to each observer printed instructions. These have been found to be of considerable assistance to officials, and what is still more important, every rider can depend on getting a *correct* report.

I think you will agree that this is a step in the right direction. It certainly is appreciated by the riders themselves. W. H. EGGINTON.

(Hon. Sec. Birmingham M.C.C.)

[A copy of the printed instructions has been forwarded, and is absolutely clear.—ED.]

THE AUDIOMETER AND THE SIX DAYS TRIALS

Sir,—As I was expecting to see comments on the subject of audiometers and vibration in your extremely interesting critique of the Six Days Trial, I would like to point out a few details which may not at the moment be evident to your contributor.

In the first place an apparatus which can be carried about and hurled violently on to railway platforms cannot be made as delicately as one would desire. Your contributor suggests that the audiometer (which was checked by separate observers and found to agree during the trials) is susceptible to ground vibration. As it happens ground vibration is very difficult to detect, except by instruments as delicately balanced as the seismograph used for earthquake measurements.

The mirror of the audiometer and the diaphragm which receives the sound are both carried on the same base, so that unless the ground vibration was sufficient actually to move the apparatus, the only result can be that the path of the spot of light would be slightly blurred instead of sharply focussed. Motor cycles are not now so noisy that there is any danger of the entire machine being moved by their passing by.

As it happens, I have tried plotting the screen, on which the spot of light appears, in squares; but I find the result rather confusing for rapid measurements, and the present instrument is arranged with a pencil mark at the zero point from which I can measure the total movement very quickly. Even on the experimental apparatus provision is made for a photographic plate, which can be moved for each machine, and in the ordinary way a travelling film is arranged so that a distinct photographic record can be taken of the sound displacement produced by each motor cycle.

In the last paragraph your contributor remarks that the apparatus merely substitutes the eye of the observer for the ear of a listener. This completely proves the value of the instrument. Whereas it is possible to distinguish for hours on end between one inch, two inches, or two and a quarter inches, it is not possible for hours on end to say that noise A was slightly noisier than noise B which occurred two hours ago.

I would be only too glad to give your contributor an opportunity to see a record taken of his own voice variations on a screen, and in the meantime I enclose two letters for your inspection, but not for publication, proving that the apparatus was successfully used during the war for the detection of difference between gun silencers at a distance. An almost identical apparatus is now being manufactured for obtaining records of the noises in ships' engine rooms.

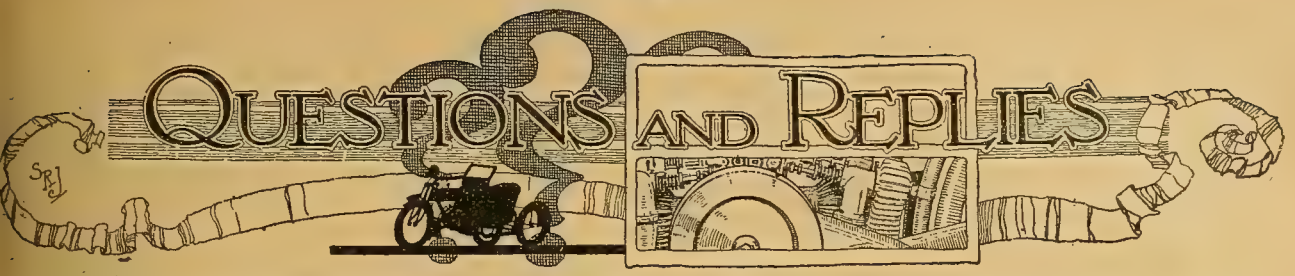
A. M. LOW, A.C.G.I., etc.

BOOKS AND MAPS FOR MOTOR CYCLISTS

Issued in conjunction with *The Motor Cycle.*

	Price net.	By post.
"MOTOR CYCLES AND HOW TO MANAGE THEM." The standard handbook on the motor cycle. Covers every subject relating to all types of motor cycles, their management and care. Twenty-first Edition. Just published	2/6	2/10
"HINTS AND TIPS FOR MOTOR CYCLISTS." Containing over 400 useful "wrinkles" and helpful hints in regard to motor cycles. Seventh Edition.	2/-	2/3
"TRACING MOTOR CYCLE TROUBLES." A reliable system for tracing motor cycle faults and of remedying any trouble when found. Fourth Edition.	2/-	2/2
"THE MOTOR CYCLE" ROAD MAPS England and Wales, Scotland, London (showing roads into and out of London and avoiding London). Mounted on linen. Set of three, complete in case.	5/6	5/10
"THE MOTOR CYCLE" ROUTE BOOK. With 32 pages of Road Maps of England and Wales, Scotland, and the London District. New Edition. Just published	5/-	5/4

Obtainable by post (remittance with order) from ILIFFE & SONS Ltd., 20, Tudor Street London, E.C.4., or of leading Booksellers and Railway Bookstalls



A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not **must be accompanied by a 2d. stamped addressed envelope for reply.** Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Gear Ratio.

I am fitting a two-speed gear box to a motor cycle with 1913 Triumph engine. What size sprocket is required on the engine-shaft to give suitable ratio? Top gear is direct. Outside diameter of belt pulley is 5½in. Sprocket on gear box has thirty-six teeth. Belt rim, 18in. diameter.—A.F.B.

Probably the most satisfactory gear ratio would be in the region of 5 to 1. A twenty-two teeth sprocket on the engine-shaft will give you a top gear ratio of 4.35 to 1 with the other sizes given in your letter. The 5½in. diameter pulley on the gear box is much too small, and you will no doubt experience a considerable amount of belt slip on the low gear, especially in wet weather. The countershaft pulley should be between 7½in. and 8in. diameter, when, of course, the sprocket on the engine-shaft will have to be decreased in size.

Has Benzole a Deleterious Effect?

As a confirmed user of benzole for my motor cycle for many years, I write to let you know that on Tuesday last, after returning from a run, I noticed my tank was leaking slightly. On taking the tank off, I found a tiny hole no larger than a pin head, but on scraping it I found it extended to the size of a pea. It was a clean round hole, nowhere near the seam of the tank, and appeared to me to have been eaten through, no doubt by the benzole. My object in writing to you is to know if I can do anything to counteract the injurious effects of this fuel, as I much prefer it to petrol in every way. Would adding a small quantity of lubricating oil or petrol assist? I may say I have frequently seen charges made against benzole in this respect, but have also seen it frequently denied, but for myself I have proved it. Knowing you have always advocated the use of benzole for many reasons, I trust you will be able to help me, as you will agree this is a matter which must be remedied, if benzole is to gain popularity and to retain it.—G.A.C.

There appears to be no justification for supposing that the hole in the tank is the result of using benzole. We use this fuel ourselves invariably and have never had any trouble; official tests have also been carried out which prove conclusively that good quality motor benzole has no ill-effect on any part of the motor cycle.

Acetylene Lighting.

I have a new Matchless outfit and am having acetylene lighting fitted. I have read articles at various times in *The Motor Cycle* advising the use of a single generator, and am anxious to use one only. I have Lucas's largest head light and the ordinary sidecar and tail lamps by the same makers. Can you advise me what generator to use?—H.E.H.

You should have no trouble with an ordinary Lucas acetylene head lamp and generator, and if you obtain an extra generator of the same type you can run the side and tail lamps from it. If you desire to run all three lamps from one generator you should obtain a light car type, but this will require a special bracket fitting to some portion of the sidecar chassis, as it is rather bulky.

An Untraceable Squeak.

If you can assist me as to the following I shall be very grateful. My machine is a 2¼ h.p. Levis. It runs very well, but there is a squeak in the engine which I have not been able to diagnose. The compression is excellent, ignition and timing correct, and carburetter in good order. There is no loss of power, and the machine runs very well. This squeak cannot always be heard, independently of whether the engine is hot or cold. My machine has not been ridden for some time now, and recently I noticed that the squeak was more perceptible than when the machine went into storage. The machine is a 1920 model, and I have oiled it liberally.—R.P.

It is very difficult to locate the cause of the trouble without inspecting the machine, but we are inclined to believe that the noise arises from some other part, and not from the engine. You should overhaul all moving parts, such as the front forks, saddle, brake work, wheel bearings, etc., also try a spot of oil on the belt fastener.

IMPORTANT DATES.

Sat., Sept. 25th—
West M'd'and Open Reliability Trial, organised by the Wolverhampton, Redditch, and Kidderminster M.C. Clubs.

Sat., Oct. 9th—
M.C. and A.C. Open Reliability Trial.

Nov. 29th Dec. 4th—
Olympia Motor Cycle Show.

Difficult Starting.

(1.) My 6 h.p. New Imperial-Jap twin engine refuses to start with kick-starter (or I should say it starts, perhaps, once in fifty times). Do you think new plugs would make an improvement? (2.) I am also troubled with grease getting on to the belt. Do you think it can be caused by pumping oil too freely into the engine?—A.J.

(1.) The causes of difficult starting are so many and various, that we cannot give you much assistance without fuller particulars of the condition of your engine. Provided the engine is in good order, the starting should be quite easy, the throttle should be about one quarter open, the extra air fully closed, and the ignition almost fully advanced. If the machine is an old one, the trouble is most probably due to air leaks either at the induction pipe joints or at the inlet valve stem guides. (2.) The grease on the belt may be due to over-lubrication of either engine or gear box, probably the latter, but as you have not stated the make or type we cannot throw any light on the matter.

Fitting Valve Stem Packings.

I have a 1919 model 4¼ h.p. B.S.A. motor cycle, on the valve stems of which I contemplate using a set of air leak preventing sleeves. The inlet valve is always very dry, and I thought that one of these fittings would be a great improvement, as it would keep the valve stem oiled. The exhaust valve is very different, however. Oil runs through the guide and down the side of the engine. Now, to me, this does not seem correct, and I thought that, by fitting one of these attachments, the apparent defect might be corrected. I am told, however, that if I do this I shall prevent the burnt oil from escaping, and this will cause excessive wear of the guide and stem. I should be glad if you could tell me if this is so.—G.S.

It is unlikely that a sleeve on the exhaust valve would cause any trouble; but as the chief object of fitting such a device is to pevent air leaks, it is really only necessary to apply it to the inlet valve, as air leaks past the exhaust valve stem have no effect on the running of the engine. No undue wear would be caused even if the waste oil was prevented from finding a way out down the valve guide. If the valve is always dry we would suggest that you add a very small quantity of lubricating oil to the petrol.

Precipitate Action.

[?] Two weeks ago I received delivery of a 2¼ h.p. motor cycle, and after four trial runs totalling less than twenty miles the machine is now laid up with a seized crankshaft. I have written the makers, so far without any reply. Can you tell me what legal remedy I may have against them in case they do not answer? Should I be in order in selling the machine by public auction and suing the makers for the balance of the purchase money?—E.S.

Unless you could prove definitely that the seizure of the crankshaft in your engine was due to negligence on the part of the makers you have no legal remedy, and you would certainly be acting on your own responsibility if you sold the machine by public auction. As no firm is likely to ignore such a complaint, we can only think that your letter has gone astray, and we would suggest that you write again, carefully quoting the facts of the case, also the engine number on your machine, and the name of the dealer from whom you obtained it. Provided you make a reasonable statement regarding your opinions as to the cause of the damage, we have no doubt that the makers will deal fairly with you.

Starting Difficulties.

[?] I own a Sociable, fitted with an 8-10 h.p. twin engine, which runs very well indeed. The starting is a most troublesome job, and not one in twenty can start it up. When going it is certainly rather noisy. I should be pleased if you could suggest some way of rectifying the difficult task of starting.—J.H.H.A.

Difficult starting in the case of V twin engines is usually due to air leaks in the induction system. These may occur at the induction pipe unions, or at the inlet valve guides if the valve stems are worn. A cure for the latter trouble is found in the various devices which can be obtained for fitting over the valve guides, and so preventing air leaks at this point. The induction pipe joints may be bound with insulation tape, as also may be the carburetter connection itself. If attention to these points does not give easy starting, the trouble evidently lies in some other direction, and may be due to the ignition system being out of order, or incorrectly timed. You do not give any particular information, however, and therefore we can only make general suggestions.

READERS' REPLIES.

Intermittent Slowing Down.

In the issue of August 26th, I see that H.B. is suffering from apparently the trouble I once experienced on a 1910 Triumph, which I eventually traced to the pins which hold the toggles in position in the carburetter being worn, and allowing them to jump out of position and lower the level.—LEO CORBY.

Raising the Gear.

With reference to enquiries by "A.B." in your issue of the 19th ult., the following information may be of use to him. I am using a sprocket with seventeen teeth on a W.D. Triumph. This gives quite satisfactory gear ratios for solo riding, and is easily obtainable from the makers. I am also using a 28×3in. Kempshall tyre, which fits the rim admirably, and shows no signs of creeping after 1,000 miles, although I do not use security bolts.—CHAS. H. W. JIGGENS.

Unaccountable Lack of Power.

Referring to "P.E.T.'s" query of August 12th, I am the owner of a 2½ h.p. Diamond-Jap, and from my experience I should say that his machine is suffering from over rich mixture and not from starvation. If he would try a 23 or 24 jet, and lower his level (this latter I did by making a ring of copper wire and putting between the float and clip) he would find his power return.—LEO CORBY.

Another Mysterious Noise.

On page 252 of August 26th, "O.W." complains of a mysterious noise in his 3½ h.p. Ariel. The following was my experience after about 10,000 miles on a 6-7 Ariel combination. A heavy grinding noise began to sound particularly when opening out or hill-climbing, but not so manifest when running easily down slight inclines. The noise was not continuous, but seemed to correspond to 1 in 4 of the engine beat. This puzzled me until I took off chain case and found about eight rollers broken off chain pins. The noise continued until I put on a new chain, when it entirely disappeared.—F. J. WRIGHT.

RECOMMENDED ROUTES.

BRADFORD TO LIVERPOOL.—G.W.L.

Bradford, Halifax, Sowerby Bridge, Ripponden, Littleborough, Rochdale, Bury, Bolton, Hindley, Ashton-in-Makerfield, St. Helens, Prescot, Liverpool.

BRADFORD TO HOYLAKE (CHESHIRE).—G.W.L.

Bradford, Wyke, Huddersfield, Meltham, Stalybridge, Stockport, Cheadle, Altrincham, Mere, Northwich, Kelsall, Chester, West Kirby, Hoylake.

BARNET TO BARMOUTH.—M.G.

St. Albans, Dunstable, Fenny Stratford, Stony Stratford, Towcester, Weedon, Daventry, Southam, Leamington, Warwick, Solihull, Birmingham, Halesowen, Stourbridge, Bridgnorth, Much Wenlock, Shrewsbury, Chirk, Llangollen, Corwen, Bala, Barmouth.

CRAWLEY TO CAMBORNE.—T.H.W.

Crawley, Handcross, Lower Beeding, Cowfold, Billingshurst, Petworth, Midhurst, Petersfield, Bramdean, Winchester, Stockbridge, Salisbury, Wilton, Dinton, Hinton, Mere, Wincanton, Ilchester, Ilminster, Chard, Yarcombe, Honiton, Exeter, Moretonhampstead, Two Bridges, Tavistock, Callington, Liskeard, Bodmin, Lanivet, Mitchell, Redruth, Camborne.

BIRKENHEAD TO SOUTHSEA.—W.W.W.

Birkenhead, Chester, Whitchurch, Hodnet, Wellington, Ironbridge, Bridgnorth, Kidderminster, Hartlebury, Worcester, Pershore, Hengeworth, Broadway, Moreton-in-the-Marsh, Chipping Norton, Woodstock, Oxford, Abingdon, E. Ilsley, Newbury, Kingsclere, Basingstoke, New Alresford, Kilmeston, Bishops Waltham, Fareham, Cosham, Southsea.

Found.

Mr. W. F. Clement, 7, Bedford Street, Harrow, picked up an oilskin coat on the 21st ult. on the Pinner Road.

Built to Order.

In a recent letter to us from Mr. E. T. Wetton, of Templar Street, Dover, this phrase occurs: "As you know, the present system of motor cycle manufacture does not permit of individuals being studied, and we are out to study the individual." With this idea prominently before him, Mr. Wetton is prepared to build motor cycles to suit any special requirements.

Service.

British manufacturers are beginning to realise the importance of service to owners of their machines. Among the makers who have given this matter attention may be mentioned G.N., Ltd., East Hill, Wandsworth, who have established a service department to assist G.N. owners, among whom are a large number who have never before owned a motor vehicle.

Running Instructions for C.A.V. Magnetos.

A neat and concise little booklet containing valuable information to those motor cyclists who have C.A.V. magnetos fitted to their mounts. Some valuable hints are given concerning these magnetos and useful instructions on their maintenance.

Care of the Tyres.

"Tyre Economy" is the title of a booklet dealing with tyre accessories, such as repair outfits, tyre stoppings, etc., issued by the County Chemical Co., Ltd., Chemico Works, Bradford Street, Birmingham. It is intended to aid motor cyclists in maintaining their tyres in good order.

A Tool Catalogue.

We are in receipt of the latest catalogue of the Godiva Tool Company, George Street Works, Coventry, which includes numerous tools of interest to motor cyclists, such as spanners of all kinds, including Quick-Grip spanners, pipe wrenches, box spanners, belt punches, tool grinders, valve removers, and some extremely useful and well-fitted up tool rolls.

A Book of Running Instructions.

A capital instruction book has been published by Veloce, Ltd., Victoria Road, Six Ways, Aston Manor, Birmingham, full of useful hints to enable riders to get the best out of their Velocette motor bicycles. The illustrations are good and clear, one of them, the method of adjusting the platinum points of the C.A.V. magneto, having been reproduced from *The Motor Cycle*. Excellent sectional drawings are to be found of the engine, gear box, and other parts.

CLUB NEWS.

North London M.C.C.

The supper run to Essenden, which ok place on the 11th inst., was highly ccessful, and, after an old-fashioned ntry repast at the Salisbury Crest otel, an impromptu concert was held.

Macclesfield and District M.C.

A reliability trial will be held on turday next, the 25th, over a fifty les non-stop course, starting at 2.30 n. prompt. Entry forms may be obned from T. Simister, 24, Jordangate, acclesfield.

Leicester and District M.C.C.

Beautiful weather favoured the third nd of the reliability trials for the rold Petty Cup, which took place ir Newtown Linford, under the auspices this club. Eighteen started, includ- two lady competitors, Miss Connie apman and Miss I. Scott, the former ng winner of the second round. This he the results were: 1, A. J. Foster; Miss I. Scott; 3, A. E. Garner.

Ilkley M.C. and L.C.C.

This club enjoyed delightful weather the occasion of its competition for the mingway Trophy. The trial was for ms consisting of two riders, either solo combination, no two gold medallists to nstitute a team, over a course of about miles to Grasmere lake and back. even teams competed, and, although elve secret checks were taken, the mers, A. Dovenor (Bradford) and J. S. xbury (Menston), on Scott machines h sidecars, had a total error of only The scheduled speed was 20 m.p.h., d, in view of the state of the roads, performance was a very fine one.

Week-end Club Events.

Sept. 26.—Leeds and District M.C. Reliability Trial.
Sept. 26.—Exeter M.C. and J.C.C. Club Run.
Sept. 26.—Bedford and District M.C. and L.C.C. Speed Test.
Sept. 26.—N.M.C.F.U. (Portsmouth). Run to Hambledon.
Sept. 26.—Scarborough M. and M.C.C. Run to Saltersgate.
Sept. 26.—Westmorland M.C.C. Reliability Run.
Sept. 26.—Reading and District M.C. and L.C.C. Run to Kop Hill.
Sept. 26.—Eastbourne and District M.C.C. Reliability Trial.
Sept. 26.—Dewsbury and District M.C.C. Run to Howarth.
Sept. 29.—Scarborough M. and M.C.C. Reliability Trial.
Sept. 30.—Worcester and District M.C.C. Hill-climb.

H. Francis Mays (Harley-Davidson) on Ringland Hill at the Norwich and District M.C. Hill-climb. He was the winner of the class for unlimited sidecars, and made the fastest time of the day on an A.B.C.

North Cheshire M.C.C.

The North Cheshire M.C.C. is holding a 100 miles reliability trial, starting from the Lizard Inn, Alderley Edge, at eleven o'clock, on October 3rd. Full particulars may be obtained from the secretary, Mr. H. Brodwick, "Somerby," Wilmslow.

Amersham, Chesham, and District M.C.C.

The results of the recent speed trials held over a favourable half-mile with a short flying start are now to hand:

CLASS 1 (350 c.c.).—1, H. Robinson (2¾ Douglas), 19⅘s.; 2, A. Howard (2¾ Douglas), 22⅗s.
CLASS 2 (500 c.c.).—1, A. McRitchie (3 A.B.C.) and V. K. Goodwin (3½ Norton) tied, 16⅘s.; 2, H. Robinson (2¾ Douglas).
CLASS 3 (Unlimited).—1, A. McRitchie (3 A.B.C.) and V. K. Goodwin (4 Triumph), 16⅗s.; 2, R. Cox (4 Triumph), 18⅕s.; 3, H. Robinson (2¾ Douglas), 19⅗s.
Run off for fastest time of day.—1, A. McRitchie (3 A.B.C.), 16s., equalling a speed of 56.24 m.p.h.

Wombwell and District M.C.C.

More than three hundred spectators witnessed the Horber Stand hill-climb on September 11th. Some excellent times were recorded over a course of nearly 880 yards. The winners on time in the solo classes, and on formula with sidecar machines, were:

CLASS 1 (300 c.c.).—1, F. Skidmore (2½ Imperial), 47⅕s.; 2, H. Massey (2½ Levis), 48⅗s.
CLASS 2 (350 c.c.).—1, F. Skidmore (2½ Imperial), 48⅘s.; 2, H. Hinckcliffe (2¾ Verus).
CLASS 3 (500 c.c.).—1, E. Reynolds (3 A.B.C.), 42⅗s.; 2, J. Lee (3½ J.A.P.), 44⅕s.
CLASS 4 (600 c.c.).—1, O. Diggles (4 Triumph), 41s.; 2, H. Thomas (4 Triumph), 42s.
CLASS 5 (750 c.c.).—1, W. Massey (4 Norton), 37⅗s.; 2, C. Diggles (4 Triumph), 40⅕s.
CLASS 6 (1,000 c.c.).—1, W. Massey (4 Norton), 38⅕s.; 2, C. Diggles (4 Triumph), 40s.
CLASS 7 (650 c.c., sidecar).—1, E. Sayles (4 Triumph sc.); 2, W. Massey (4 Norton sc.).
CLASS 8 (1,000 c.c., sidecar).—1, W. Massey (4 Norton sc.); 2, E. Sayles (3½ Sunbeam sc.).
Fastest time of day, W. Massey (4 Norton).

North-Western Centre A.C.U.

Once again Norton riders have shown their speed on the occasion of the North-Western hill-climb at Heyden Bridge. The course was just over one mile, which took in an acute S bend. The fastest men were L. Mitchell (solo) and G. Cowley, jun. (sidecar).

The results were as follows:

CLASSES 1 and 2.—1, L. C. Crabtree (2¾ A.J.S.); 2, Geo. Cowley (2¾ A.J.S.); 3, H. Clayton (3½ Marlow).
CLASS 3.—1, L. Mitchell (3½ Norton); 2, T. Simister (3½ Norton); 3, L. C. Crabtree (2¾ A.J.S.).
CLASS 4.—1, L. Mitchell (3½ Norton); 2, T. Simister (3½ Norton); 3, J. L. Cruickshank (3½ Norton).
CLASS 5.—1, L. Mitchell (3½ Norton); 2, E. Bottomley (7-9 Harley-Davidson); 3, T. Simister (3½ Norton).
CLASSES 6 and 7.—1, T. Simister (3½ Norton); 2, O. E. Carter (3½ O.C.-J.A.P.); 3, Geo. Cowley, sen. (2¾ A.J.S.).
CLASS 8.—1, Geo. Cowley, jun. (3½ Norton sc.); 2, H. Taylor (6 Bradbury sc.); 3, T. Simister (3½ Norton sc.).
CLASS 9.—1, Geo. Cowley, jun. (3½ Norton sc.); 2, E. Bottomley (7-9 Harley-Davidson sc.); 3, A. Horrocks (Morgan c.c.).
FASTEST TIME OF DAY.—L. Mitchell (3½ Norton), 1m. 5⅖s.
FASTEST SIDECAR TIME.—Geo. Cowley, jun. (3½ Norton sc.), 1m. 19⅘s.
CLUB TEAMS.—1, Stockport Motor Club; 2, Manchester Motor Club; 3, Oldham Motor Club.

N.M.C.F.U. (Coventry).

A successful hill-climb took place on September 18th at Saintsbury Hill, near Broadway, with the following results: Fast climb (solo class): 1, F. Baron (2¾ Omega), 2m. 40s. Sidecar class: 1, S. Healy (4 Triumph sc.). Slow climb of fifty yards: 1, S. Healy (4 Triumph).

An Echo of the War.

The Motor Cycle has been so closely connected with the Tank Corps since its inception that it must be more than a coincidence that there are now no fewer than four ex-Tank Corps men on the editorial staff.

Tolerant Police.

We hear much of the notorious districts (such as Kingston) where the motorist exists in fear and trembling, and where even a bent number-plate may spell disfigurement of his licence; but where is the other extreme? The police of Coventry and Birmingham, both motor centres, are very tolerant: but our readers may know of other claimants to the appreciation of the motor cycle world.

Reconstruction.

Owing to increasing volume of business, Messrs. Binks have reconstructed the company, the capitalisation now being in the neighbourhood of £75,000.

Motor Cycles in South Africa.

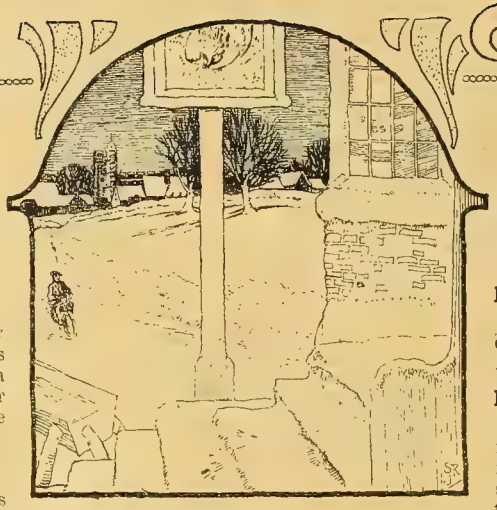
An official census of motor vehicles in the Union of South Africa reveals a total of 11,904 motor cycles owned in the four provinces concerned. The figures given below are for 1919, and since British manufacturers have been exporting considerably this year, the figures are now increased.

	Motor cycles.	Cars, etc.
Cape Colony	.. 2,269	4,389
Natal	.. 1,466	1,638
Transvaal	.. 7,622	6,609
Orange Free State ..	.. 547	1,776
Total for Union	.. 11,904	14,412

The J.A.P. and the Lay Press.

Regarding the several wild reports concerning the makers of J.A.P. engines, and which have appeared in the daily papers, we have received from Messrs. Prestwich the following explanation: "About three weeks ago, disagreement arose between the Shops Committee and the management. Owing to certain statements made by the Shops Committee the firm refused to treat further with the then existing committee. On the 14th inst., 180 men in the assembling section downed tools contrary to agreement, demanding the reinstatement of the former committee. As a consequence these men were not allowed to restart the following morning.

"The firm is in no way opposed to dealing with representatives of the men who properly represent their interests. There is no question of grievance with the remaining one thousand employees of the firm who are still at work. Rumours that the firm has closed down are totally untrue, and without any foundation."



Second-hand Prices.

As yet the customary autumnal drop in prices is not at all pronounced. The figures represent the highest and lowest prices quoted for some of the most widely offered models.

A.J.S., 6 h.p., sidecar, 1918-19	£165–£200
B.S.A., 4½ h.p., sidecar, 1919	£115–£135
Clyno, 2½ h.p., 2-stroke, 1916-20	£52–£70
Douglas, 2¾ h.p., 1914-16	£40–£60
Douglas, 2¾ h.p., 1918-20	£75–£98
Douglas, 4 h.p., sidecar, 1917-20	£75–£155
Harley-Davidson, 7-9 h.p., sidecar, 1918-19	£120–£195
Harley-Davidson, 7-9 h.p., sidecar, 1920	£200–£225
Indian, 7-9 h.p., sidecar, 1920	£155–£210
James, 4 h.p., sidecar, 1919-20	£120–£145
Levis, 2½ h.p., 2-stroke, 1919-20	£50–£65
Matchless, 8 h.p., sidecar, 1920	£185–£235
Norton, 4 h.p., sidecar, 1916-20	£128–£170
P. & M., 3½ h.p., sidecar, 1919-20	£110–£155

Triumph, 4 h.p., sidecar, 1919-20	£125–£175
Zenith, 8 h.p., sidecar, 1920	£155–£210

A SCOOTER RECORD?

Ninety-one miles in five hours is the holiday jaunt covered by this young lady, Miss Cissie Chapman, of Leicester, aged fifteen years, on her Auto-glider.

Petrol Prices in U.S.A.

1s. 10d. and 1s. per gallon are the prices of petrol and paraffin respectively in America.

Planning it Early.

One of our readers evidently believes in the pleasures of anticipation. A request for a route covering the best scenery in Scotland reached us last week, the writer requiring this for a tour he intends making in July, 1921.

Roadside Accommodation.

The A.A. staff of hotel inspectors have evidently been busy during the past year, for they report that no fewer than one hundred and five appointments have been cancelled, refused or deferred. And there can be no doubt that, whether owing to this work of the A.A. or because the hotels begin to realise who their best customers are, the standard of accommodation and catering on the motoring highways has gone up enormously lately. But so, alas! have prices.

Fuel.

If all statutory gas companies having an annual coal consumption of more than 5,000 tons were compelled to install, within a limited period, the necessary plant for the production of crude benzole, there would at once be available a further 30,000,000 gallons of motor spirit annually. This and other facts regarding the fuel situation are being pointed out to the Government by the Motor Legislation Committee, who represent all interests from the motor cyclist to the manufacturer.

Speed with a Flat Tyre.

How fast can one travel on a motor cycle with the rear tyre deflated, and for how long? The motor cyclist who has a puncture at speed, and rides for a few hundred yards before pulling up realises how the deflated tyre affects the steering and comfort. R. O. Clark's sensational finish in the T.T. on a partly deflated tyre will always be remembered by those who witnessed it. A competitor in a pre-war Bristol Trial covered practically the whole of the course with no tyre on his sidecar wheel, while in the speed tests at Brooklands, at the conclusion of the Six Days Trials, L. A. Bees did most of his half-hour with a flat rear tyre, yet managed to average 27.5 m.p.h. Bees's machine was a Beardmore-Precision, which has an efficient spring frame. Also during this trial, J. Westwood Wills accomplished about twenty miles on his Verus without a tyre on the rear wheel, and Horsman's recent hour record on his Norton was finished on a flat tyre.

he Coast Ride.

Mr. G. W. Wilkin, who is driving a h.p. Wilkin sidecar round the coast of reat Britain, had made good time up to st Saturday when he arrived at Grimsby. le left Liverpool on the 8th with an fficial of the A.C.U. as passenger.

he Late R. L. St. J. Harmsworth.

The motor cycle pastime loses a staunch pporter in Mr. R. L. St. J. Harmsorth, a son of Sir R. L. Harmsworth, nd a nephew of Lord Northcliffe, ho died recently. He was a very keen otor cyclist, and while for some time efore his death the state of his health revented him from taking an active part the pastime, he continued to take a een interest in motor cycling matters ght up to the end. He was a very skilful river of Sunbeam and Indian machines.

idecars Barred.

A 160 miles reliability trial, made up two non-stop sections of approximately fty miles each, for solo machines only, ill be held by the Motor Cycling Club October 16th. The start will be at ten clock at Purley, with luncheon at eigate and the finish at Ripley at about p.m. The short distance, late start, and rly finish should make it convenient r the competitors.

Vest Midland Open Reliability Trial.

Including the flexibility and stopping id starting tests, there are thirteen bserved hills in the route of the West idland open reliability trial on September 25th. The start (at a.m. prompt) ill be at Bromsgrove, then through Redtch, Worcester, Malvern, Bromyard, rlow, and Bridgnorth, finishing at the Stewponey Hotel on the Wolverhampton-Kidderminster road: in all, 160 miles. Including many well-known names, an entry of eighty-seven has been received. Teams, as follow, participate: Worcester (4), Redditch (3), Wolverhampton (1), Kidderminster (1), three independent, and Norton and B.S.A. trade teams.

THE AUTO CYCLE UNION STAFF AT WINDSOR.

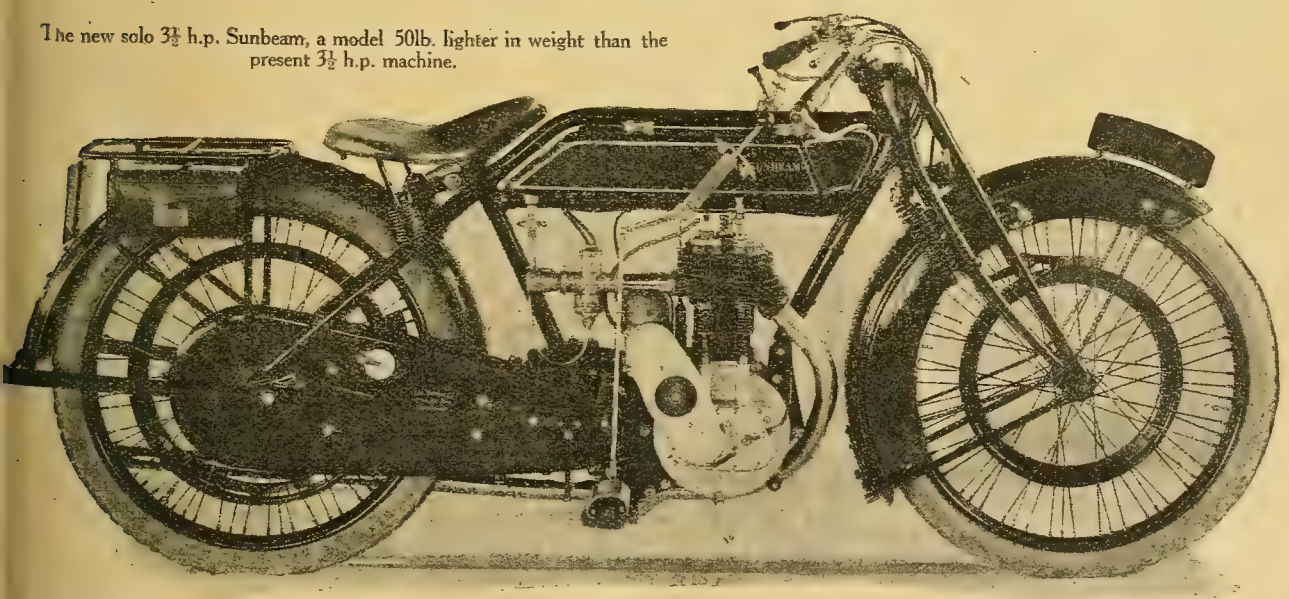
Members of the Auto Cycle Union on the occasion of the recently organised river trip to Windsor. The party boarded the steam launch at Windsor, and proceeded to Marlow. Several well-known A.C.U. officials will be observed in the group.

Invitation to the A.C.U. Committee.

The Norfolk and Norwich Motor Cycle Club has invited the committee of the A.C.U. to dine with them on the evening previous to the committee meeting, which is to be held on Friday, October 1st. The dinner will take place at the Maid's Head Hotel, Norwich.

LIGHTER MACHINES FOR 1921.

The new solo 3½ h.p. Sunbeam, a model 50lb. lighter in weight than the present 3½ h.p. machine.



T is now safe to forecaste that several 1921 models will be lighter—a policy long urged by *The Motor Cycle*. Seveil well known firms are experimenting ith 3½ h.p. machines for solo work, among hich the Sunbeam illustrated on this age is the first. For some time past it as been apparent that the average single esigned as a double purpose mount is too heavy for purely solo use, and in view of the demand for lighter solo machines, accentuated by the increasing cost of petrol, it would not be surprising if weight is not more seriously considered by designers of all types of machines.

The Sunbeam illustrated is 50 lb. lighter than its larger sister, which has been so successful as a medium-powered sidecar machine. It is also smaller. The new model has been produced to comply with the numerous requests received by the makers for a machine constructed on the lines of the winning machine of the 1920 Tourist Trophy. It made its *début* in competition last Saturday, when it was ridden by G. Dance in the Liverpool M.C. trial in North Wales.

AN ELIMINATING TRIAL IN NORTH WALES.

Successful Sporting Event Organised by the Liverpool M.C.

A real test hill—Bwlch-y-Groes, used by the Liverpool Club as a timed hill to find the winner of the Reliance Cup from among the seven competitors who made non-stop runs.

A SERIES of freak hills and a timed climb of Bwlch-y-Groes were the means adopted last Saturday by the Liverpool Motor Club to find the winner of the Reliance Cup Trial.

There were seventy-two starters from Queensferry at 9 a.m., and before Bwlch-y-Groes was reached at midday twenty had retired. Others dropped out in the afternoon, and by the time Llangollen had been left behind and Alt-y-Bady was a thing of the past, those with clean sheets could almost be counted on one hand.

The First Test Hill.

It was an excellently organised trial, and but for a misplaced arrow very near the start, there was not a hitch in the whole proceedings. The first hill was twenty miles away, but those who were misled by the arrow in question—ourselves included—covered nearly forty miles to reach it.

The course was through Hawarden, Hope, Coed Talon, Llandegla, down the Horse Shoe Pass, and through a soft and narrow lane to the Conquering Hero Inn—a fitting name also for the test hill which started from it.

It is a narrow lane with a surface of mud and stones; deep gulleys at awkward angles and a gradient in places of about 1 in 4 were its chief characteristics. The clean ascents were few, but owing to the baulking, there is no saying who would have made non-stop climbs had they been given the chance. One failure meant a blockage—and, very soon the hill was strewn with those who could not get up, and those who might have done had the road been clear.

At one time there were as many as fifteen stranded riders in as many yards, and the familiar smell of Castrol filled the air. Half-way up the hill an Aero Morgan without a competitor's number blocked the hill for all but the nimblest soloist, and, lower down, S. Hall's Morgan was sending the mud flying with its back wheel in an attempt to get going again.

Some remarkably good restarts were made. H. Karslake (Brough) slithered up with his rear wheel first in one gutter and then in the other. S. H. Bann (4 Norton) was climbing splendidly when he skidded and fell. The sole lady competitor (Miss Mary Dane, also on a Norton) attracted the admiration of everyone present by the manner in which she managed her mount. She was forced to stop several times, but by sheer pluck she finally disappeared into the upper regions of the hills.

Losing Time.

V. Horsman (4 Norton) was seen calmly waiting for the crowd to clear, keeping his engine ticking over in neutral. F. H. Moody (6 A.J.S. sc.) ran back, and for a few minutes was across the fairway. H. Newey (2¼ Levis) cleverly avoided him, however, and made quite one of the best climbs. W. Brandish and L. Crisp (both on 4½ Humbers) had practically a clear course, and made good climbs, as did Clark on the 2¾ Coulson. At the foot of the hill E. Foster (8 Dot sc.) had retired with a jammed gear box.

Most of the competitors were now late, but a few succeeded in making up their time before Bala (43 miles) was reached. From Bala to Bala *via* Bwlch-y-Groes was 41 miles, and there was some hard riding in this section to make up lost time, with the result that several competitors ran out of petrol. S. V. Barne (8 Sunbeam) was one of these, and th stop unfortunately took place on hi timed climb of Bwlch-y-Groes; while S Parker (8 Enfield sc.) had only sufficien fuel to carry him over the summit, wher our spare can was used to advantage.

Bwlch-y-Groes.

The performances on the famous Wels hill were consistently good; much bette in fact, than when the A.C.U. Six Day competitors climbed it in the 1919 tria H. F. Edwards (6 Zenith sc.) experience trouble with his front cylinder. H. Drur (2¾ A.J.S.) retired owing to time lost wit the expanding brakes on his rear whee and G. J. Baragwanath (4 Triumph) ha a mishap to his gear box.

Miss Dane (4 Norton) stopped for som reason on the lower part of the hill, and restarting, made an excellent ascent, did J. E. Greenwood (3½ Sunbeam sc.).

As to which was the fastest machine o the hill was a moot point. The Sunbeam ridden by Eric Williams and G. Dan appeared to share equal honours with th Nortons piloted by V. Horsman, N. Sclater, and Jack Fox. The Norton team by the way, were even at this point prim favourites for the team prize. W Kautlehner (5½ Wilkin sc.) did particularly well.

On the descent to the side of Bala lak A. H. Reade (2¾ Viper) misjudged h speed, and fell, so disabling his machin that he finished at that point.

After lunch the surviving competitor were taken *via* Corwen to Llangolle

An Eliminating Trial in North Wales.—

then up the famous Alt-y-Bady, the first of five observed hills in the afternoon's performance.

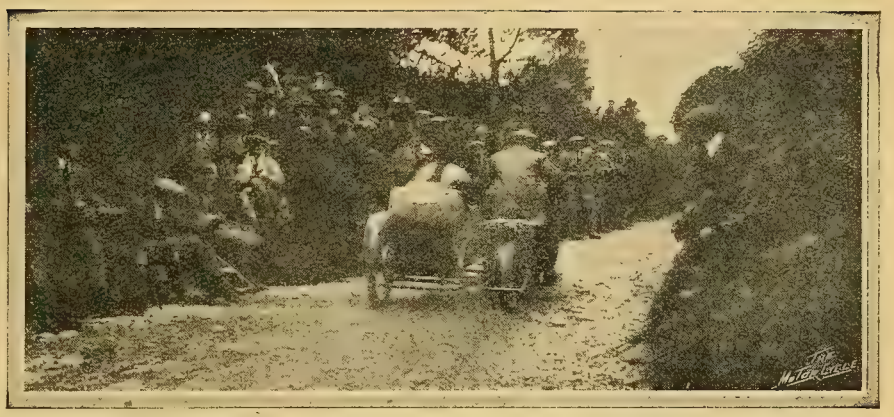
Incidentally, many competitors got away from Bala with a roar reminiscent of the T.T. One is constrained to wonder why. A trial is not a race, and a demonstration of acceleration was not necessary. There was more noise in the quiet main street of Bala than at any other point of the course.

The surface of Alt-y-Bady was better than when the M.C. and A.C. included it in their trial in June of last year.

Notwithstanding last year one or two sidecars succeeded in making clean climbs, this year none were successful. The failures, however, do not count against the present-day sidecar machine, which will usually climb any gradient where wheel grip can be obtained. O. Wade (6 A.J.S. sc.) unfortunately burnt out his clutch, and had to retire, thus robbing several teams of their hope of the team prize. He was nominated as a member of three teams, *i.e.*, the Liverpool Club's team, and both the A.J.S. teams.

Nine Clean Ascents.

Only about nine solo competitors appeared to make non-stop climbs. These were: H. C. Sclater (3½ Norton), H. Ashley (6 L.M.C.), R. Arnold (4 A.J.S.), J. A. Newman (3½ Sunbeam), Eric Williams (3½ Sunbeam), Hunt Fox (4¼ B.S.A.), S. W. Ratcliffe (3½ N.U.T.), L. Crisp (4½ Humber), and W. Brandish (4½ Humber). But all of these more or ess used their feet, and it will rest vith the judges to decide which was and vhich was not foot-slogging. J. F. Lidtone (2¼ James) was making a splendid limb for so small an engine, when he kidded into the gutter. Dance, on the ew light solo Sunbeam—the 1921 model n the experimental stage—struck a paricularly bad patch, and got his wheel pinning. H. J. Scale (New Scale twotroke) was going well when he skidded nto the soft ground from which no cometitor had emerged without stopping. '. Hill's 2¾ h.p. H.B. stopped for a imilar reason, and E. L. Boston (3 .B.C.), at his second attempt, skidded ompletely round, and fell. H. Greaves Beardmore - Precision) made a good limb, but crossed to the wrong side, and stopped with his wheel spinning as if in Plasticine.



Alt-y-Bady at Llangollen, a freak hill of the worst character which claimed all but nine of the competitors. No sidecars succeeded in making a clean ascent.

Sun Trevor.

In a few miles the competitors were in Llangollen again with another observed hill, taken *en route*, and a mile or so outside the town was Sun Trevor—the *pièce de résistance* in the Liverpool Club's last year's event. The surface was much better, however, and instead of a repetition of the expected scenes on Conquering Hero, very few failed to make good ascents. E. L. Boston (A.B.C.) fell, T. D. Addinsell (4 Triumph) and K. Wilson (6-8 Rex) suffered from belt slip.

Eric Williams and Dance made spectacular climbs with their Sunbeams. Miss Dane was also good to watch, while J. H. Davies (4 Triumph) mounted the bank, but made a splendid recovery and, straightening out, completed the climb with ease.

Almost a continuation of Sun Trevor was the Old Horse Shoe Pass—observed hill, No. 4, in the afternoon route, but after such hills as Alt-y-Bady and Conquering Hero, it gave little trouble to the tired competitors.

One more observed hill near Mold, and the survivors checked in at Queensferry in the dusk.

Thus the aspirants for the Reliance Cup were reduced to eight, as only the following claimed non-stop runs: N. C. Sclater (4 Norton), V. Horsman (4 Norton), Eric Williams (Sunbeam), J. A. Newman (3½ Sunbeam), G. A. Strange (3½ James), L. Crisp (4½ Humber), and W. Brandish (4½ Humber). Scater, however, lost time at the finish.

On the whole it had been an excellent day's sport, in weather that had threatened in the morning, but was sunny at intervals. One brief rain and fierce hailstorm was encountered while descending from Bwlch-y-Groes.

The actual winner of the Reliance Cup can only be known when the committee have worked out the results of the timed climb of Bwlch-y-Groes, the formula used being that recommended by *The Motor Cycle*, *i.e.*, $\frac{C \times T^2}{W}$ From observation, it appeared that the chief award will go to a Norton or a Sunbeam, and that the coveted team prize will be won by riders of the former.

No other teams qualified apparently; but probably a prize will also be given for the best performances by a club team, in which case honours may go to the Worcester team on Sunbeams.

AT THE START. Competitors at Queensferry.

INCIDENTALLY.

The 3½ Sunbeam and 3½ Wilkin sidecars, driven by J. E. Greenwood and W. Kautlehner respectively, demonstrated the possibilities of a well-tuned 500 c.c. single.

Hunt Fox (4¼ B.S.A.) rode splendidly, and after making a clean ascent of Alt-y-Bady fell at the top.

Riders of spring frame machines had the easiest time. These included E. L. Boston (A.B.C.), J. C. Walker (2½ Edmund), R. B. Clark (Coulson), and H. Greaves (Beardmore-Precision).

BROOKLANDS MEETING POSTPONED.

On Saturday last the B.M.C.R.C. and Essex Motor Club were to have held a meeting at Brooklands. Unfortunately, rain caused a postponement until October 2nd, the championship to be run off on October 9th.

Almost immediately after the decision to abandon the event the weather cleared and the sun shone once more.

A Flat twin sidecar in the Edinburgh and District Motor Club Two-day Trial. J. Joynson, 5-6 h.p. Coventry Victor, climbing Amulree.

THE SCOTTISH AUTUMN TRIAL.

First Day of the Sporting Two-day Event Organised by the Edinburgh M.C. Forty-two Competitors Materialised for the Scottish Two-day Trial to Oban last Saturday.

SUNSHINE and an autumnal crispness in the air were the early morning conditions when at eight o'clock the first riders left Murrayfield car terminus on what promised to be one of the most sporting and perfectly organised trials yet held. That, indeed, has been the aim of the organisers, and a glance at the programme created a refreshing sense of the unique individuality of the event. The booklet opens with a well written description of the magnificent country traversed, and is liberally illustrated with panoramic views of the Highlands. The programme is unconventional, and so is the official ruling. H. M. Batten (A.B.C.) led the way, carrying official time, together with two other travelling marshals, R. Knowles (Norton) and J. Steel (A.C.E.). From Amulree onwards the route lay through an unbroken grandeur of Highland scenery. Knowles was our travelling companion, and from him we were sorry to learn that some months must elapse ere Mrs. Knowles, after her regrettable accident in the Six Days, will again be able to indulge in any active sport.

Unchangeable as its world's old sister hills, Amulree claimed its usual victims. Steel, riding the huge four-cylinder A.C.E. solo, found his gear lever locked, and ran back, falling badly. Knowles tackled the hill in English fashion, as the Scotch observers put it, and almost fell. Harry Fairley (A.B.C. sc.) was under-powered, and had to push, while Ralston (3½ James sc.) shed his passenger. One competitor fell grotesquely, to the amusement of the spectators, while J. A. Russell (2¼ Levis) made a clever and plucky ascent. R. M. Ritchie (A.B.C.) and J. Manuel (4 Triumph) also failed, while Alan Hill (Scott), H. M. Batten (A.B.C.), and A. Peffers (4 Indian Scout) made good solo ascents.

Bad Road Surfaces.

Among the sidecars, Roger Macrae (Harley-Davidson sc.), A. F. Downie (6 A.J.S. sc.), and J. Beck (3½ Sunbeam sc.) were outstandingly good. On the mountain top, between Amulree and the deer forest of Kenmore, A. H. Alexander (3½ Douglas) suffered a mechanical breakage, which compelled his retirement.

Descending Kenmore to the valley of the Tay, one was thenceforth torn asunder by conflicting sentiments which involved the indescribable grandeur of the scenery and the unspeakable condition of the roads. For miles there were pot-holes from gutter to gutter. There was no riding track, and, while the machines were subjected to a terrific shaking, the riders were a-swill with slush which deluged everyone, and caused many ignition troubles.

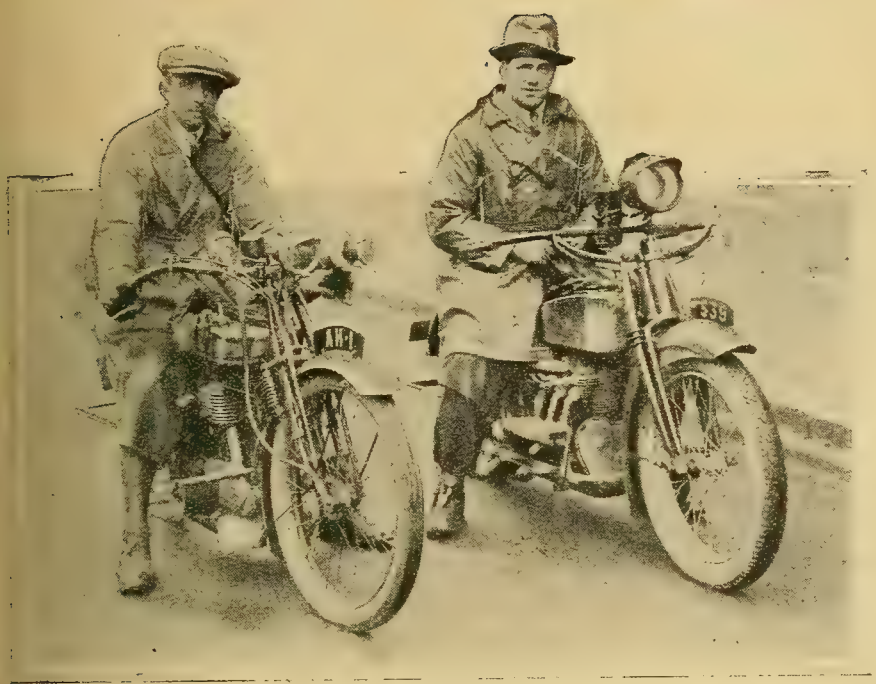
One of the A.B.C.'s was bounced clean into the ditch at speed, the machine pitching nose first with a metallic clash, and rebounding into the middle of the road. It speaks well for the frame design that literally no damage resulted.

Passing through Killin, lunch at Crianlarich was heartily welcomed, and during the afternoon the roads were vile in parts, with many good stretches, while the sunlight shower and cloud effect on the mountains was entrancingly beautiful.

"Rest and be Thankful" claimed but two failures—A F. Sidford (Matchless), who missed his gear, and Harry Fairley (A.B.C sc.). Steele, on his A.C.E., fairly made the spray fly, and the spirit of freedom which pervades all Scottish trials was evident by the total disregard for schedule time. Many arrived early at the tea control at the delightful resort of Inveraray, but they were allowed to check in and enjoy the benefit of their misconduct, having extra time for tea.

Ben More, Ben Lui, and Ben Cruachan were among the mountains seen from the subsequent height of land, and, becoming accustomed to diving nose foremost down the precipitous descents, negotiating hair-pin corners, and ricocheting over pot-holes, we pressed on through the traditional home of the MacGregors amidst a bewildering array of crags and island dotted waters.

At eight o'clock the first men checked in at Oban, where everyone seemed dazed by the splendour of the scenery and loveliness of the surface traversed. There were outstanding incidents to discuss. One of the A.B.C. men collided with a cow, but bounding off it continued cheerfully on his way, leaving the cow in the middle



Two travelling marshals, R. Knowles (Norton), and J. Steel (A.C.E.), who, with H. M. Batten led the trial.

of the road with its legs aspiring stiffly skywards. Russell, on the little Levis, had lost no marks.

First Day's Retirements.

H. Baxter (3½ Norton), S. Hubbard (2¾ Blackburn), T. Gillies (3½ Sunbeam), A. H. Alexander (3½ Douglas), S. C. J. Joynson (5-7 Coventry Victor, sc.), R. R. James (8 Blackburne), and D. Cairns (o.h.v. Ford).

The following had lost marks: J. Steel (10 A.C.E.), 1; R. M. Richie (3 A.B.C.), 1; J. Manuel (4 Triumph), 1; H. Fairley (3 A.B.C., sc.), bronze possible; D. Ralston (3½ James, sc.), bronze possible; J. M. Boyack (3½ Sunbeam), bronze possible; A. F. Sidford (8 Matchless), bronze possible.

Twenty-eight were still in the running for gold medals at the end of the first day.

DISCOMFORT ON THE ROAD.

IF the average man in the street were asked which was the more uncomfortable method of locomotion—a high-class motor car chassis with a seat made out of packing case wood and upholstery made out of a sack stuffed with wood shavings, or an unsprung motor cycle—he would almost undoubtedly reply that the motor cycle would afford the least comfort. We can assure our readers that this is quite untrue.

We recently had occasion to drive a small but very high-class chassis out of London equipped in the manner described. No one can imagine the appalling discomfort. Every bump seemed to be conveyed from the nether portion of one's anatomy direct to the brain, and at the end of the journey distinct fatigue and a slight inclination to headache were experienced. We have on many occasions traversed the road in question on a motor bicycle fitted with somewhat indifferent spring forks and a Brooks 170B saddle, and we can assure those who do not motor cycle that this form of vehicle was by far the more comfortable of the two. The reason, of course, is obvious. The car, being without its body, was much too light for its power, and the chassis springs did practically no work at all. Also, in the ordinary way, one would be sitting on spring cushions, and in this case there was practically no cushion at all.

The experience demonstrated the important part played by the seat cushions and subsequent experiments in various sidecars show that designers of the latter type of vehicle do not fully appreciate the value of a good deep well sprung cushion.

MIDLAND CENTRE A.C.U.

THE following letter, of interest to all Midland clubs, has been received from the local Consul of the Midland Centre of the A.C.U.:

"Sir,—My attention has been called to a letter in your issue of September 16th from the hon. trials secretary of the recently formed Worcester and District M.C.C., in which that gentleman states that his club has decided to form another centre, for which the name of the 'Three Shires Centre A.C.U.' is proposed.

"In view of the discussion which took place at the meeting which was recently held in Birmingham, when representatives from such clubs as Coventry, Wolverhampton, Nuneaton, etc., were present, when it was decided that the whole object of the A.C.U. Centre scheme would be defeated if a number of centres a small distance apart were formed, at least at this early stage since the inception of the scheme, I am more than surprised that the trials hon. secretary of the Worcester Club should be so keen to rush into print to disclaim the 'authority' of the representatives of no fewer than ten clubs, all older than the Worcester Club; though perhaps do not claim to be the 'only sporting club.'

"It was pointed out to the representatives of the Worcester Club by myself—I happened to be in the chair—that, whilst the A.C.U. Local Centre rules provided for the formation of fresh centres when 'at least six affiliated clubs in a district shall have agreed to support the constitution of a centre,' the formation of a second centre so near Birmingham, which was the natural geographical centre, and which should be looked upon as such without any suspicion of jealousy on the part of clubs outside Birmingham itself, would only tend to set a precedent which would ultimately result in the collapse of the whole object of the Centre scheme: an expression of opinion which was unanimously supported by those present, except the Worcester delegates.

An Appeal to Sportsman'hip.

"The Worcester Club is, I understand, a very live body, but it must not mistake enthusiasm for power and zeal, and it must further live up to its motto as a sporting club, by refraining from sending out notices to clubs which have already expressed their desire to join the A.C.U. Midland centre, which centre was laid down by the A.C.U. itself, and asking them to associate with them (the Worcester Club) in the formation of a different centre, before the official centre has got properly going!

"Such conduct does not make for harmony, or for that unity which is so very desirable amongst motorists in these strenuous days. The Worcester Club would do well, I am sure, to consider the words addressed to their delegates before they withdrew from the meeting in question, which were to the effect that they should reconsider their attitude, bearing in mind that the times did not permit of petty and needless jealousies, and throw in their lot with the Official Midland Centre, at least till such time as the centre was in full working order, and the Worcester delegates had served their apprenticeship, before endeavouring to set up an 'opposition' centre, only some twenty-six miles from the official centre.

"The whole question will come up for discussion at the next general meeting of the A.C.U., and I personally shall do everything possible to prevent the extension of the centre scheme as at present laid down, until time has shown the necessity for more centres, as I am strongly of the opinion that a multiplicity of centres must lead to failure of the whole scheme.

"R. Vernon C. Brook,

"Chairman, Midland Centre A.C.U."

C15

CLUB NEWS. Continued

Luton and South Beds A.C.

A successful hill-climb was held recently by the above club, an excellent entry being received. The hill selected had a severe gradient, and included two slight bends. The rough surface did not deter competitors, all of whom made good times. The results were as follows :

CLASS 1 (350 c.c.).—1, S. Watson (2¾ Douglas), 53s.; 2, F. Child (2¾ Douglas), 55⅘s.; 3, A. L. Swan (2¾ New Imperial), 63⅗s.

CLASS 2 (600 c.c.).—1, J. Hill (3½ Rudge Multi), 42½s.; 2, T. Bourlet (3 A.B.C.), 43⅘s.; 3, R. Baker (3½ Triumph), 47½s.

CLASS 3 (1,000 c.c.).—1, J. Hill (3½ Rudge Multi), 42s.; 2, T. Bourlet (3 A.B.C.), 45s.

CLASS 4 (Passenger Machines).—1, H. Revre (5-6 James sc.), 49⅘s.; 2, F. Child (8-10 Morgan), 57⅗s.

Bradford M.C. and L.C.C.

Although only resuscitated a short time ago, membership of the club now approaches three hundred, and at the last meeting a further batch of twenty-two were enrolled. The prosperity of the club is undoubtedly due to the energetic organisation of its programme. As an example of this, a series of technical lectures on motor cycle mechanism has been arranged for the winter months. The sporting side is also well catered for; incidentally, a hill-climb and speed trials will be held on the 25th and 26th inst.

Members are advised that a very handsome club badge in gilt and enamel is now available. The price is 6s. 6d., including handle-bar bracket.

Dorchester M.C. and L.C.C.

At the hill-climb recently held on Ashton Hill G. W. Churchill proved the winner in the 350 c.c. class on a 2¾ h.p. Verus-Blackburne (37s.) The 600 c.c. class resulted in a close contest between H. Peckham and A. E. Hann, both riding 3 h.p. A.B.C.'s, the latter winning in 26⅘s. by the narrow margin of ⅘s. In the unlimited class, J. Caslake (7-9 Harley-Davidson) romped up in 25s. The passenger classes had to be abandoned.

A Scottish Non-stop Run.

Glasgow Motor Cycle Clubs' 100 Miles Open Reliability Trial.

On one of the test hills in the Glasgow M.C.C. 100 Miles Reliability Trial. Hillier taking his 3½ Ariel up Leith Hill.

A SUCCESSFUL 100 miles trial was held on Saturday, September 18th, by the above club. Starting from Strathblane, the course was through Lennoxtown, over the Fintry Hills, through Blane Valley, up Cult Brea, and Kyber Pass.

There were twenty-nine starters, of whom nineteen failed to complete the course non-stop.

M. Simons (4 Triumph) retired two miles from the finish with belt trouble, and M. Simpson (6 A.J.S. sc.) had trouble with his sidecar connections about the same place.

A crowd of spectators watched the competitors ascend Cult Brea, from the top of which a fine view can be had of the road below. The road through the Kyber Pass was rough, and several competitors came to grief amongst the loose stones. R. Brown ran into the bank, and came off. Goodwin (3 Enfield) retired with a broken frame, and G. Munro, who had not been going well stopped with a choked jet.

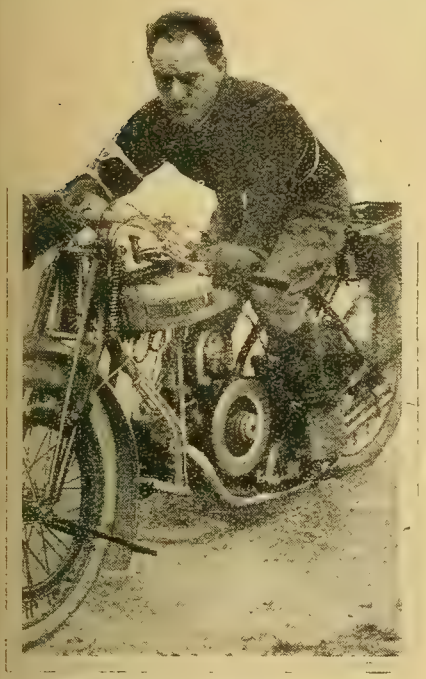
Noticeable for their clean assents of the hill in the Pass were Murdoch Frazer (8 Enfield), Geo. Kelly (6 A.J.S.), and R. Robertson (3½ Sunbeam), who all appeared to have plenty in hand.

Thanks to the hon. trials secretary, Mr. D. J. Baddley, and his fellow enthusiasts, the trial was well organised, and proved an enjoyable afternoon to both competitors and spectators.

A West of England Hill Climb.

THE Bristol Club received excellent support from both trade and private owners for the recent hill-climb on Kingsdown Hill near Bath. It was a particularly good day for Douglas riders, who record eleven "firsts" and five "seconds": but the Sunbeams and Nortons did not allow the local men to have all their own way. G. W. Walker, on a Norton, made fastest solo time; while in the sidecar classes H. R. Davies, on his 2¾ h.p. A.J.S. sc., gained this honour by ⅕s. from the redoubtable Dance.

G. Dance, on his Sunbeam, in the sidecar class; he made second fastest sidecar time, being ⅕ sec. slower than the fastest man.



H. Thorpe, who, on a 3½ h.p. Douglas, won five awards. He rode one of the 1921 models, with central camshaft and valves above the cyliner.

The full results were as follows:

CLASS 1 (275 c.c., Open).—1, A. E. Tozer (2¼ O.K.), 75⅕s.

CLASS 2 (275 c.c., Open, Expert Barred).—1, R. B. Horstmann (2½ Sun-Villiers).

CLASS 3 (275 c.c., Club Open).—1, A. E. Tozer (2¼ O.K.), 71s.

CLASS 4 (275 c.c., Club, Expert Barred).—1, A. E. Tozer (2¼ O.K.), 71⅕s.

CLASS 5 (350 c.c., Open).—1, G. Dance (2¾ Sunbeam), 36⅕s.; 2, H. R. Davies (2¾ A.J.S.), 38s.

CLASS 6 (350 c.c., Open, Expert Barred).—1, R. Passey (2¾ Douglas), 45⅕s.

CLASS 7 (350 c.c., Club, Open).—1, E. Kickham (2¾ Douglas), 38⅕s.; 2, C. Sgonina (2¾ Verus), 43⅕s.

CLASS 8 (350 c.c., Club, Expert Barred).—1, R. Passey (2¾ Douglas), 48⅕s.

CLASS 9 (500 c.c., Open).—1, G. Dance (3½ Sunbeam), 34⅕s.; 2, G. W. Walker (3½ Norton), 34⅖s.

CLASS 10 (500 c.c. Open, Expert Barred).—1, G. H. Tucker (3½ Norton), 37⅖s.; 2, R. Passey (2¾ Douglas), 46⅕s.

CLASS 11 (500 c.c., Club Open).—1, H. Thorpe (3½ Douglas), 34⅖s.; 2, E. Kickham (3½ Douglas), 37s.

CLASS 12 (500 c.c., Club, Expert Barred).—1, H. N. Walker (3½ Norton), 42⅖s.; 2, R. Passey (2¾ Douglas), 46s.

CLASS 13 (750 c.c., Open).—1, G. W. Walker (3½ Norton), 32⅖s.; 2, H. S. Davis (2¾ A.J.S.), 33⅕s.

CLASS 14 (750 c.c., Open, Expert Barred).—1, G. H. Tucker (3½ Norton), 41⅖s.; 2, R. Passey (2¾ Douglas), 44⅕s.

CLASS 15 (750 c.c., Club, Open).—1, H. Thorpe (3½ Douglas), 34⅖s.; 2, C. Sgonina (3½ Norton), 34⅖s.

CLASS 16 (750 c.c., Club, Expert Barred).—1, R. Passey (2¾ Douglas), 47⅖s.

CLASS 17 (Unlimited, Open).—1, G. W. Walker (3½ Norton), 33⅖s.; 2, G. Dance (3½ Sunbeam) and H. R. Davies (2¾ A.J.S.), 33⅖s. tied.

CLASS 18 (Unlimited, Open, Expert Barred).—1, N. F. Chant (6 N.U.T.), 33⅖s.; 2, G. H. Tucker (3½ Norton), 36⅕s.

CLASS 19 (Unlimited, Club, Open).—1, H. Thorpe (3½ Douglas), 34⅕s.; 2, C. Sgonina (3½ Norton), 35⅕s.

CLASS 20 (Unlimited, Club, Expert Barred).—1, H. W. Jacobs (8 Zenith), 39s.; 2, F. C. Hardwell (7-9 Indian), 44⅕s.

CLASS 21 (Sidecars up to 350 c.c., Open).—1, H. R. Davies (2¾ A.J.S.) and G. Dance (2¾ Sunbeam), 42⅕s., tied.

CLASS 25 (500 c.c., Sidecars, Open).—1, H. R. Davies (2¾ A.J.S.), 41⅕s.; 2, G. Dance (3½ Sunbeam), 41⅖s.

CLASS 26 (500 c.c., Sidecars, Open, Expert barred).—1, G. H. Tucker (3½ Norton), 50⅕s.

CLASS 27 (500 c.c., Sidecars, Club, Open).—1, E. Kickham (3½ Douglas), 42⅖s.

CLASS 28 (500 c.c., Sidecars, Club, Expert Barred).—1, F. Cooke (3½ Sunbeam), 62⅖s.

CLASS 29 (750 c.c., Sidecars, Open).—1, G. Dance (3½ Sunbeam), 41⅕s.; 2, F. Thorpe (3½ Douglas), 42⅖s.

CLASS 30 (750 c.c., Sidecars, Open, Expert Barred).—1, G. Tucker (3½ Norton), 45⅖s.

CLASS 31 (750 c.c., Sidecars, Club, Open).—1, E. Kickham (3½ Douglas), 43⅖s.

CLASS 32 (750 c.c., Sidecars, Club, Expert Barred).—1, F. Baxter (4 Norton), 49⅖s.

CLASS 33 (Unlimited, Sidecars, Open).—1, F. Thorpe (3½ Douglas), 41⅖s.; 2, G. Dance (3½ Sunbeam), 42⅖s.

CLASS 34 (Unlimited, Sidecars, Open, Expert Barred).—1, A. Kingsmith (7-9 Harley-Davidson), 46⅖s.; 2, P. Whale (7-9 Harley-Davidson), 50⅖s.

CLASS 35 (Unlimited, Sidecars, Club, Open).—1, E. Kickham (3½ Douglas), 42⅖s.; 2, G. Tucker (3½ Norton), 46⅖s.

CLASS 36 (Unlimited, Sidecars), Club, Expert Barred).—1, F. Baxter (4 Norton), 48⅖s.

SCOTTISH INTER-CLUB TEAM TRIAL.

REGISTERING the only complete non-stop performance, Edinburgh No. 1 team proved the winners of the "John Bull" Cup, the principal award in this event, which was briefly described and illustrated in our issue of last week.

The performances on Amulree were, on the whole, disappointing, and on the first lap there were many failures, chiefly owing to bad riding. It came as a great surprise to many that even at the end of the first lap only one team was still intact. From that time on the results were a foregone conclusion, and the number of stoppages were really considerable. Here a rider would fail from a sooted plug, another from wheel spin, another from the injudicious tackling of a hairpin bend, and so on, till comparatively few individual riders completed the second lap without loss of marks. The route was not unduly severe for a Scottish trial, though it must be admitted that rough surfaces and greasy, timber-ploughed roads made the task of riding to the schedule of 18 m.p.h. none too easy.

Each team consisted of four members, two riding solo and two sidecar machines, and the club performances giving total non-stop mileages are as follows:

1st, Edinburgh No. 1.—H. M. Batten (3 A.B.C.), J. Steel (3½ Norton), R. S. Macrae (7-9 Harley sc.), and G. Grinton (7-9 Harley sc.)—224 miles.
2nd, Western No. 2.—185 miles.
3rd, Berwick.—163½ miles.
Edinburgh No. 2, 130½ miles; Falkirk, 128 miles; West Fife, 102½ miles; Dundee, 100½ miles; Western No. 3, 82 miles; Western No. 2, 59½ miles.

London—Bala—Dunstable.

Essex M.C. Twenty-four Hours Trial.

THE official list of awards for this event of the Essex Motor Club, reported in our last issue, is now to hand. Considering the strenuous nature of the trial, 410 miles in twenty-four hours, including ascents of Bwlch-y-Groes and Rhosgwalian, the high proportion of finishers is most satisfactory.

GOLD MEDALS.—A. C. Rhodes (3½ N.U.T.), F. W. Applebee (2¼ Levis), V. Olsson (7 Indian), W. Simpson (7 Indian sc.), E. A. Bridgeman (7 Indian sc.), D. S. Parsons (5 Rover sc.), W. C. Hemy (6 A.J.S. sc.), W. A. Fell-Smith (8 Blackburne sc.), F. S. Spouse (8 T.B.), and R. G. Mundy (10 G.N.).

SILVER MEDALS.—A. Stranger (5 Stranger) and E. Porter (3 A.B.C. sc.).

BRONZE MEDALS.—R. E. Humphreys (2½ Kingsbury), B. A. Hill (Morgan), E. J. Pittock (5-6 James sc.), J. W. Wills (2¾ Verus sc.), and C. Pressland (8 Crouch).

A Single-cylinder Mediumweight.

A 2¾ h.p. Engine and Novel Spring Forks.

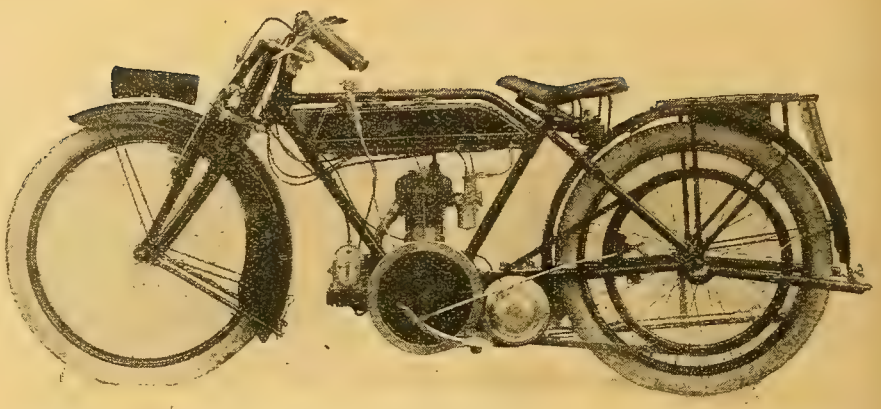
TO the many firms who are using the 2¾ h.p. Blackburne engine as a power unit there is yet another addition, the Marloe Motor Cycle Co., of 151, Coventry Road, Bordesley, Birmingham, having recently introduced such a machine. Chain and belt drive with a two-speed Burman gear box form the transmission, a clutch and kick-starter being incorporated. The general specification follows that of previous Marloe models, but heavier gauge spokes and round base rims are now fitted, while a 7in. rear guard affords protection for the rider. Many little details go to show that the machine is the production of practical riders, and as examples we may quote the very large toolbag and the tank with all its fittings on one side so as to be instantly removable.

Perhaps the most interesting feature of the machine is the new spring fork, in which leaf springs replace the more usual coil type.

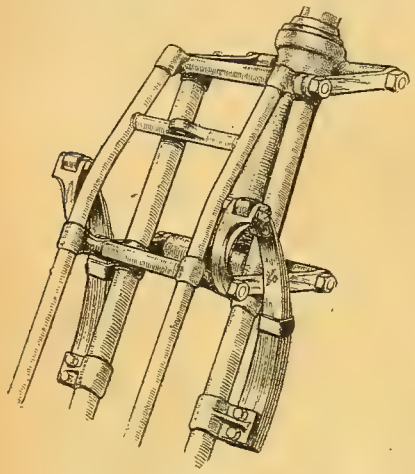
Brazed to the main members of the fork blades are spring pads, which allow the leaf springs to start parallel with the head. The main leaves then curve forward, and are attached to an extension of the lower links by means of an elongated loop.

Thus the springs are easily cleaned, and do not interfere with the fitting of wide guards, and, in addition, it is claimed that they help to ensure rigidity on corners.

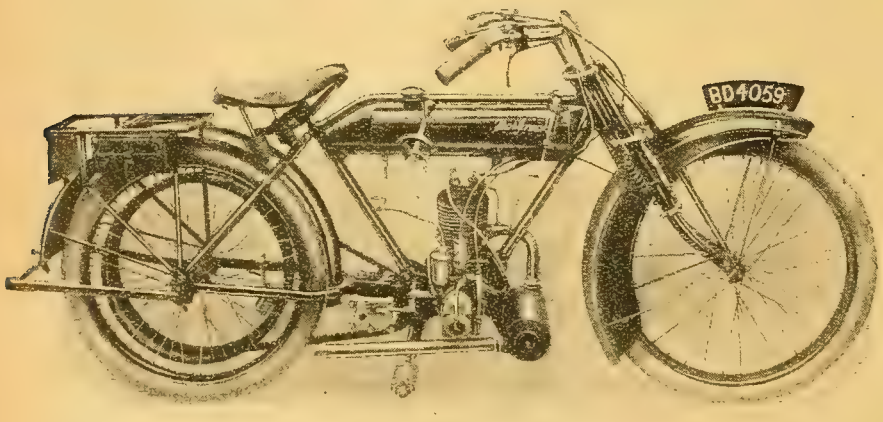
Fitted with 26in. × 2¾in. Hutchinson tyres, a short stiff frame, and a choice of Amac, B. and B., or Senspray carburetter, the machine is an attractive proposition for the solo rider at the price of 100 guineas.



The latest model Marlow is fitted with a 2¾ Blackburne engine and a 7in. rear mudguard. Several other detail improvements have been carried out.



The Marlow spring fork in which leaf springs replace the usual coils and leave the fork clear for wide guards.



Another newcomer to lightweight ranks, the Norbreck, which has been produced with the idea of marketing a sound proposition at a low price.

The Norbreck Two-stroke Lightweight.

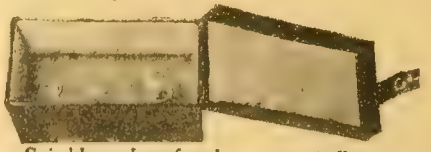
WELL-KNOWN components are embodied in this attractive looking lightweight. An Arden 70 mm. by 70 mm. (269 c.c.) engine will be standard, although our illustration of the experimental model shows a Union. Best and Lloyd drip feed lubrication, B. and B. carburetter, C.A.V. magneto, and Arden spring forks are included in the specification of the single-speed model which sells at £50 8s. Or with a Burman two-speed gear box, the retail price is £56 8s.

The maker is Douglas H. Valentine, with temporary premises at 24, Finedon Road, Wellingborough.

A SPARE BULB CASE.

MOTOR cyclists who are fortunate enough to have electrically-lighted machines will fully appreciate the difficulties of the safe storage of spare electric bulbs. Spare bulbs are a necessity if one does not want to be delayed on the road, as sometimes bulbs give out just when they are least expected to do so.

This handy little box in imitation leather contains three bulbs: for the head, tail, and side lamps on a sidecar outfit. They are held in bayonet sockets, and cannot receive damage when carried in this way.



Suitable sockets for three spare bulbs are provided in this neat leather-covered case.

The case, which may be obtained with or without bulbs, is sold by Messrs. H. Taylor and Co., Ltd., 21a, Store Street, Tottenham Court Road, London, W.C.1.

The same firm is also marketing a luggage grid specially made to fit 4 h.p. Douglas sidecar outfits; the device can be readily applied to the standard chassis, and forms a useful adjunct for touring. Quite a large quantity of luggage may be accommodated, thus eliminating much inconvenience.

MR. H. TAYLOR, Managing Director.

What's in a NAME?

THIS depends entirely upon the reputation behind it. Over ten years of successful trading, founded on sound business lines, backed by TAYLOR service and personality, has built one of the most progressive motor cycle, light car, and accessory businesses in London to-day.

Everything motorish for the motorist, at London's lowest prices, is the Taylor Slogan, both at Store Street, and at our commodious showrooms at South Kensington.

GET IT AT

TAYLOR'S

is the sound advice offered by the seasoned motor cyclist to his best pals. Few motor cycle establishments have grown as the House of Taylor has done, and our progress is due to the recommendation which our fair dealings and the service we render, has prompted.

RIDE while you PAY

Our easy payment system enables motor cyclists to purchase their favourite mount out of income without disturbing their capital.

HERE'S AN EXAMPLE

CALTHORPE 2-stroke (maker's price) ..	£74 19 0
Down payment of 25%	18 14 9
Interest on unpaid balance at 7½% ..	4 4 4
Making unpaid total of	60 9 7
Divided into 12 monthly payments of ..	5 0 10

Remember—we carry through with our customers the whole of a deferred payment contract. A large variety of all the best makes of machines in stock, for immediate delivery.

Sole London and District Agents for A.J.S. and EXCELSIORS and have at the moment a few of these high-class mounts ready for immediate delivery. Write for catalogue. Below we give a further selection of machines in stock.
